

CLAS N* EXCITATION RESULTS FROM PION AND KAON ELECTROPRODUCTION

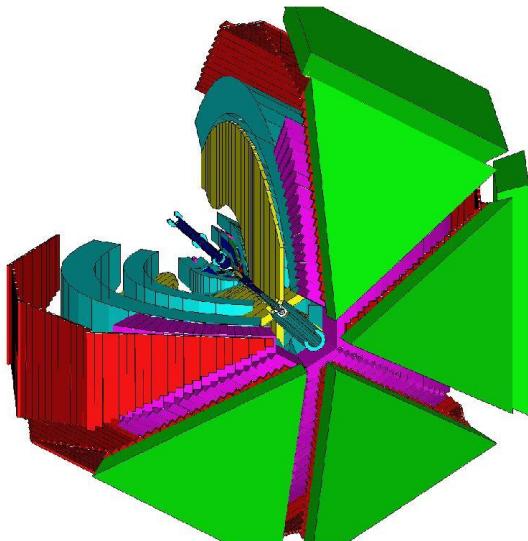

Daniel S. Carman
Jefferson Laboratory

Outline

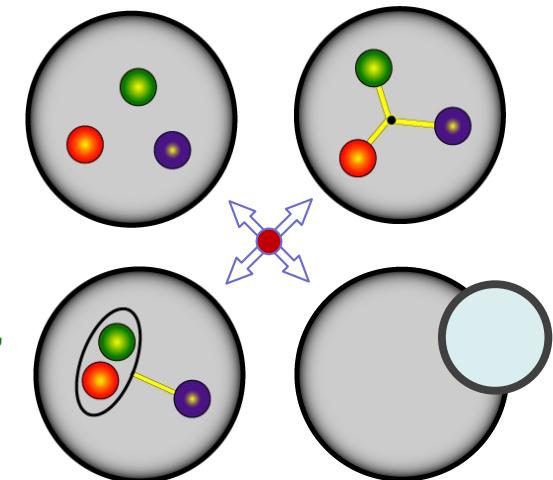

- N* Spectrum & Structure
- CLAS $\gamma, p \rightarrow \pi N, K\bar{N}$ Data
- CLAS12 N* Program
- Concluding Remarks

CLAS N* Program

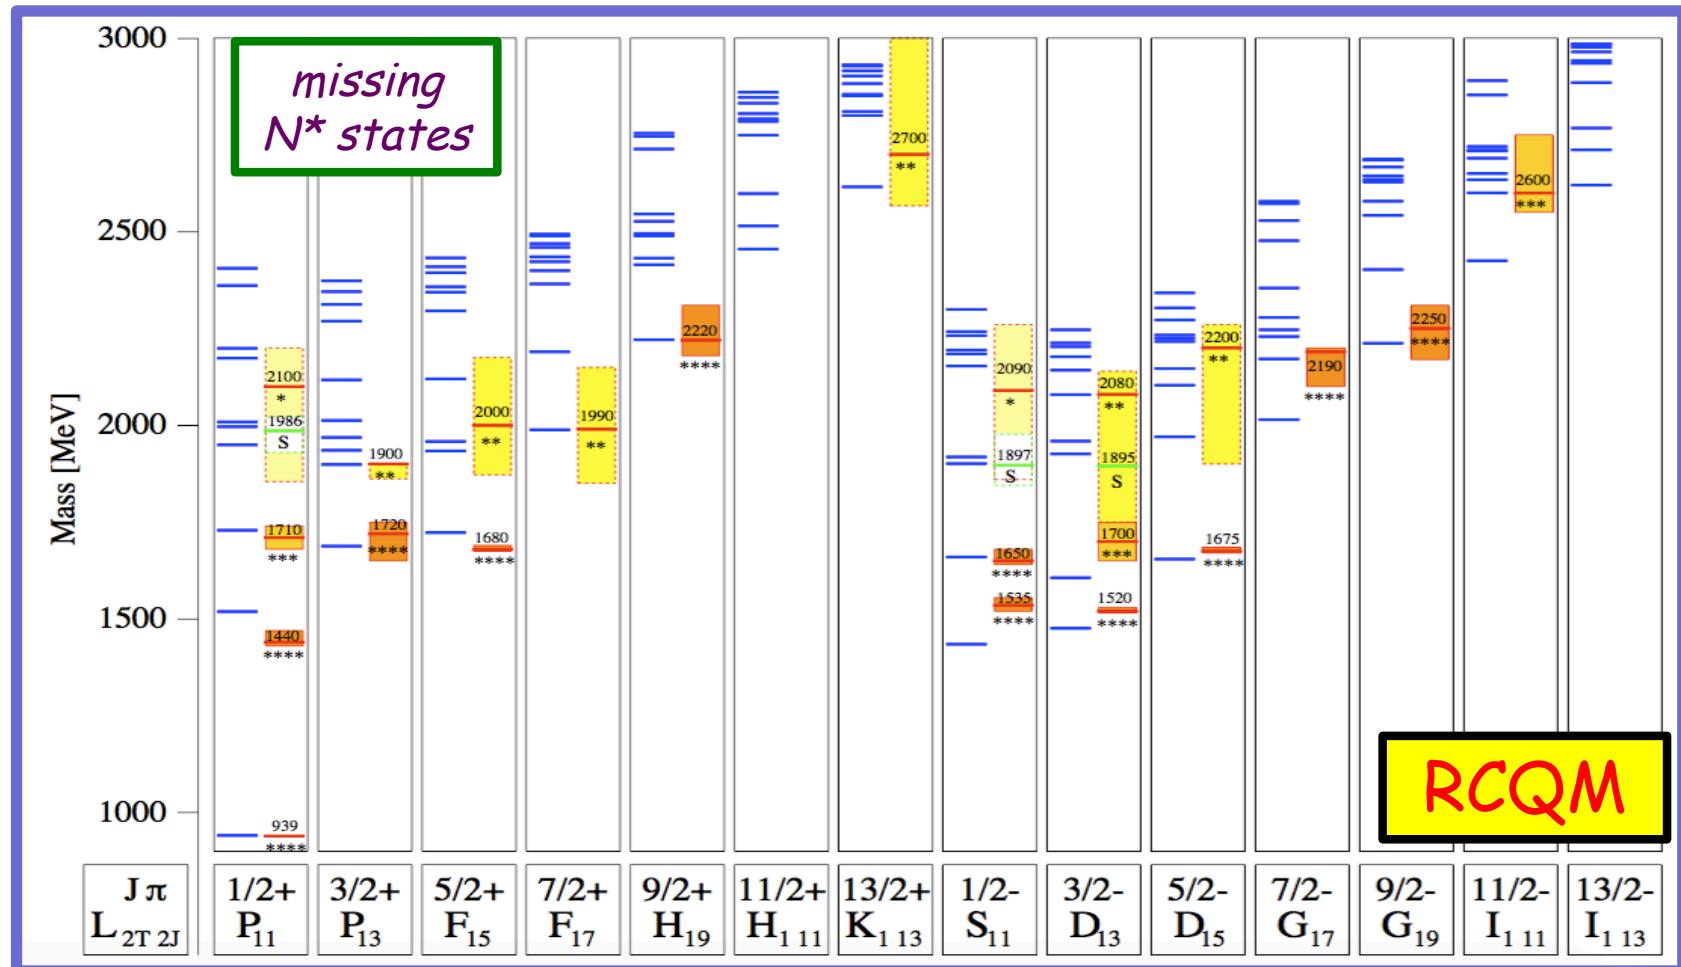

The N* program is one of the key physics foundations of Hall B

- CLAS was designed to measure γN and $\gamma_v N$ cross sections and spin observables over a broad kinematic range for exclusive reaction channels
 - $\pi N, \omega N, \phi N, \eta N, \eta' N, \pi\pi N$
 - KY, K^*Y, KY^*
- *Consistent results for N* parameters from different exclusive channels with different hadronic couplings and backgrounds offers model-independent support for findings*
- The program goal is to probe the **spectrum** of states and their **structure** through studies of the Q^2 evolution of the $\gamma_v NN^*$ electrocouplings
 - *Probe the underlying degrees of freedom of the nucleon*
 - *Study the non-perturbative strong interaction that generates N* of different quantum numbers from quark and gluons*

Excited Nucleon Spectrum

[Löring, Metsch, Petry, Eur. Phys. J. A 10, 395 (2001)]

Recent LQCD predictions support CQM

[Dudek, Edwards, PRD 85, 054016 (2012)]

Excited Nucleon Structure

- Nucleon structure is more complex than what can be described accounting for quark degrees of freedom only

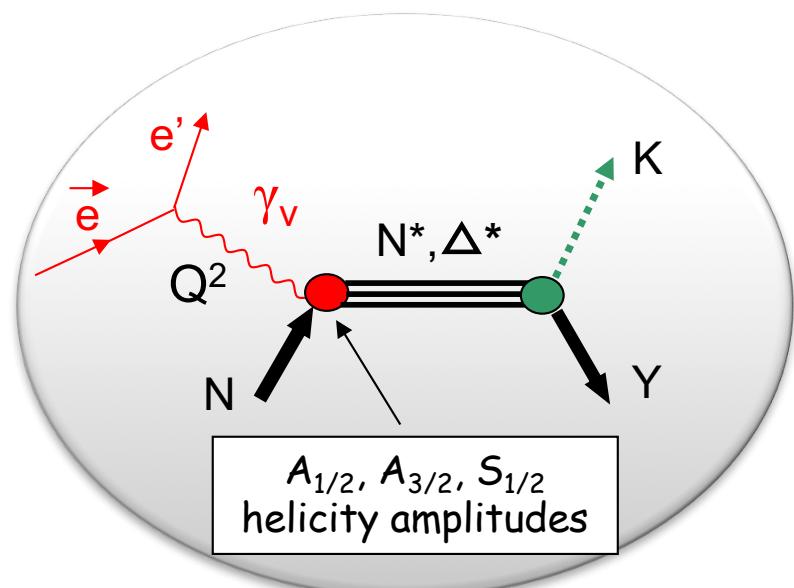

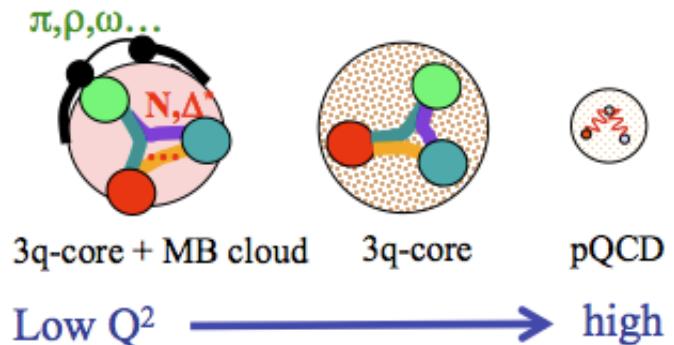

- Low Q^2 : structure well described by adding an ($Q^2 < 5 \text{ GeV}^2$) external M-B cloud to inner quark core

- High Q^2 : quark core dominates; transition from ($Q^2 > 5 \text{ GeV}^2$) confinement to pQCD regime

- Electroproduction studies from low to high Q^2 probe the detailed structure of the N^* states through the $\gamma_v NN^*$ electrocoupling amplitudes

- Elucidate relevant degrees of freedom and their evolution with distance scale

- Only source of information on many facets of the non-perturbative strong interaction in the generation of different N^* states from quarks and gluons

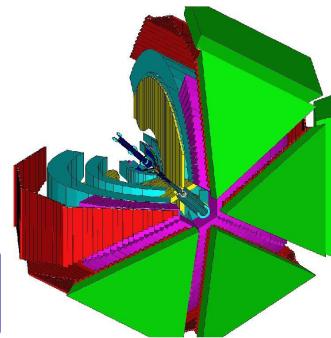

CLAS N* Program Measurement Overview

Reaction	Observable	Q^2 (GeV 2)	W (GeV)	Reference

CLAS: 1997 - 2012

CLAS Physics Data Base <http://clas.sinp.msu.ru/cgi-bin/jlab/db.cgi>

Extraction of Electrocouplings

Reaction Channel	N^*, Δ^* States	Q^2 ranges of $\gamma_v NN^*$ Electrocouplings (GeV^2)
$\pi^0 p, \pi^+ n$	$\Delta(1232)3/2^+$ $N(1440)1/2^+, N(1520)3/2^-, N(1535)1/2^-$	0.16 - 6.0 0.30 - 4.16
$\pi^+ n$	$N(1675)5/2, N(1680)5/2^+, N(1710)1/2^+$	1.6 - 4.5
ηp	$N(1535)1/2^-$	0.2 - 2.9
$\pi^+ \pi^- p$	$N(1440)1/2^+, N(1520)3/2^-$ $\Delta(1620)1/2^-, N(1650)1/2^-, N(1680)5/2^+,$ $\Delta(1700)3/2^-, N(1720)3/2^+, N'(1720)3/2^+$	0.25 - 1.5 0.5 - 1.5
http://userweb.jlab.org/~mokeev/resonance_electrocouplings		

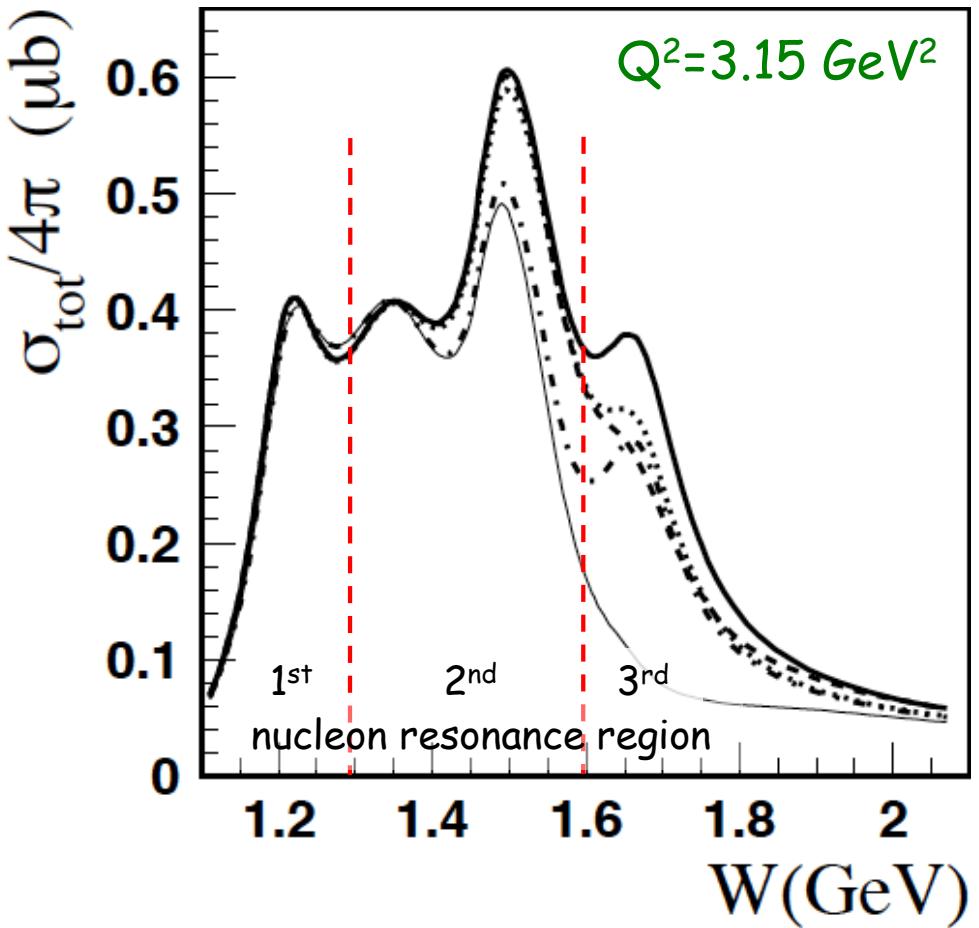

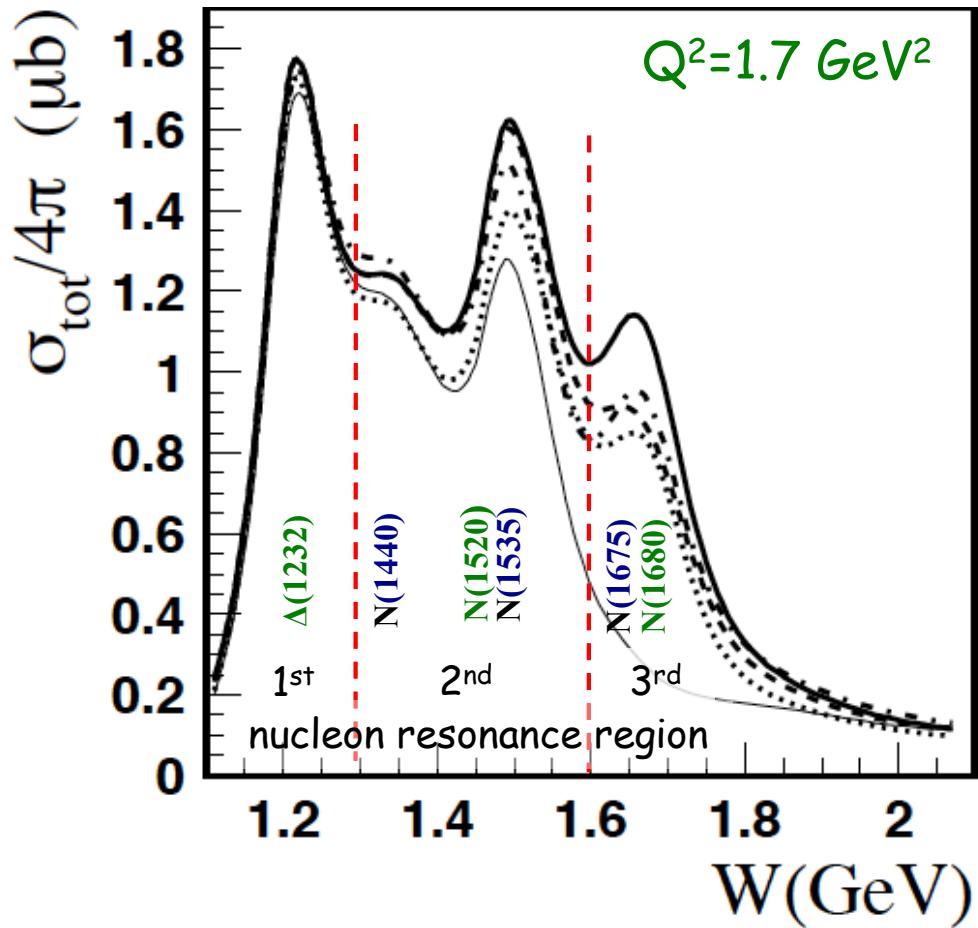

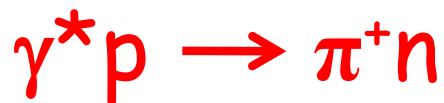

Analysis codes for single and double PS meson production:

- Unitary Isobar Model (UIM)
 - Fixed-t dispersion relations (DR)
 - Data-driven reaction model for $\pi^+ \pi^- N$ (JM09, JM16)
- } for πN and ηN

[Aznauryan et al., Int. J. Mod. Phys. E 22, 1330015 (2013)]

[Mokeev, FBS 57, 909 (2016)]

Total Cross Sections

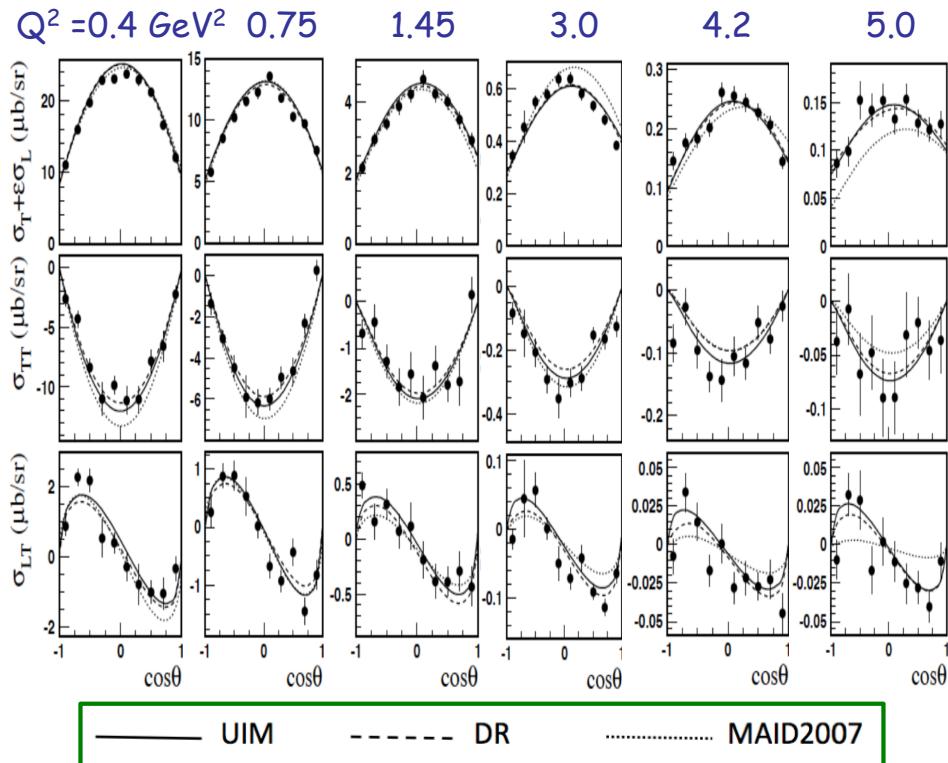

[Park et al., PRC 77, 015208 (2008), PRC 91, 045203 (2015)]

First Resonance Region

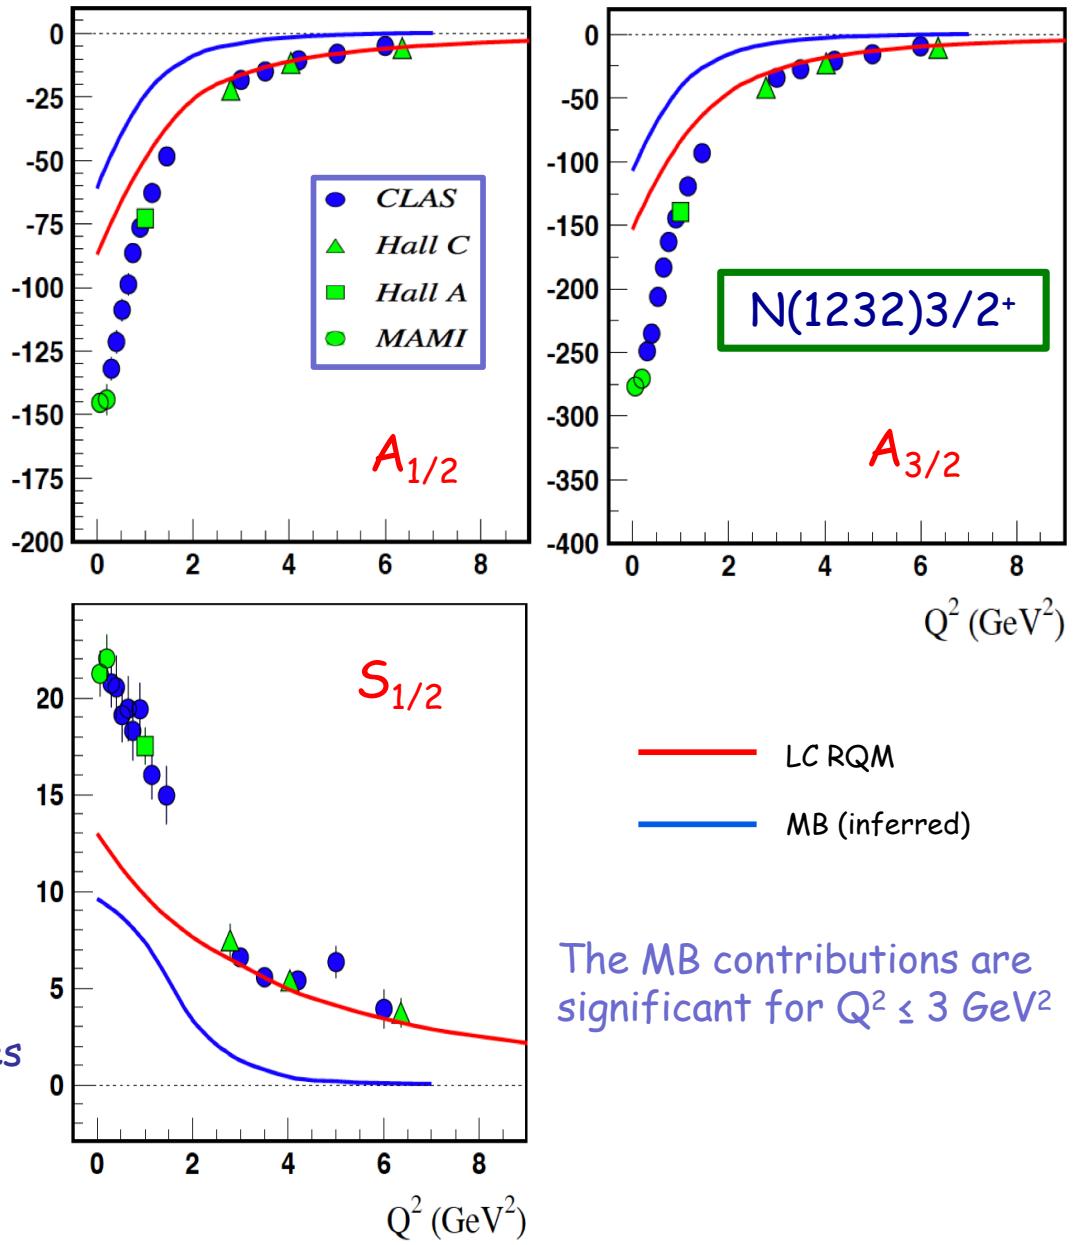

$\gamma^* p \rightarrow \pi^0 p$

$W = 1.232 \text{ GeV}$

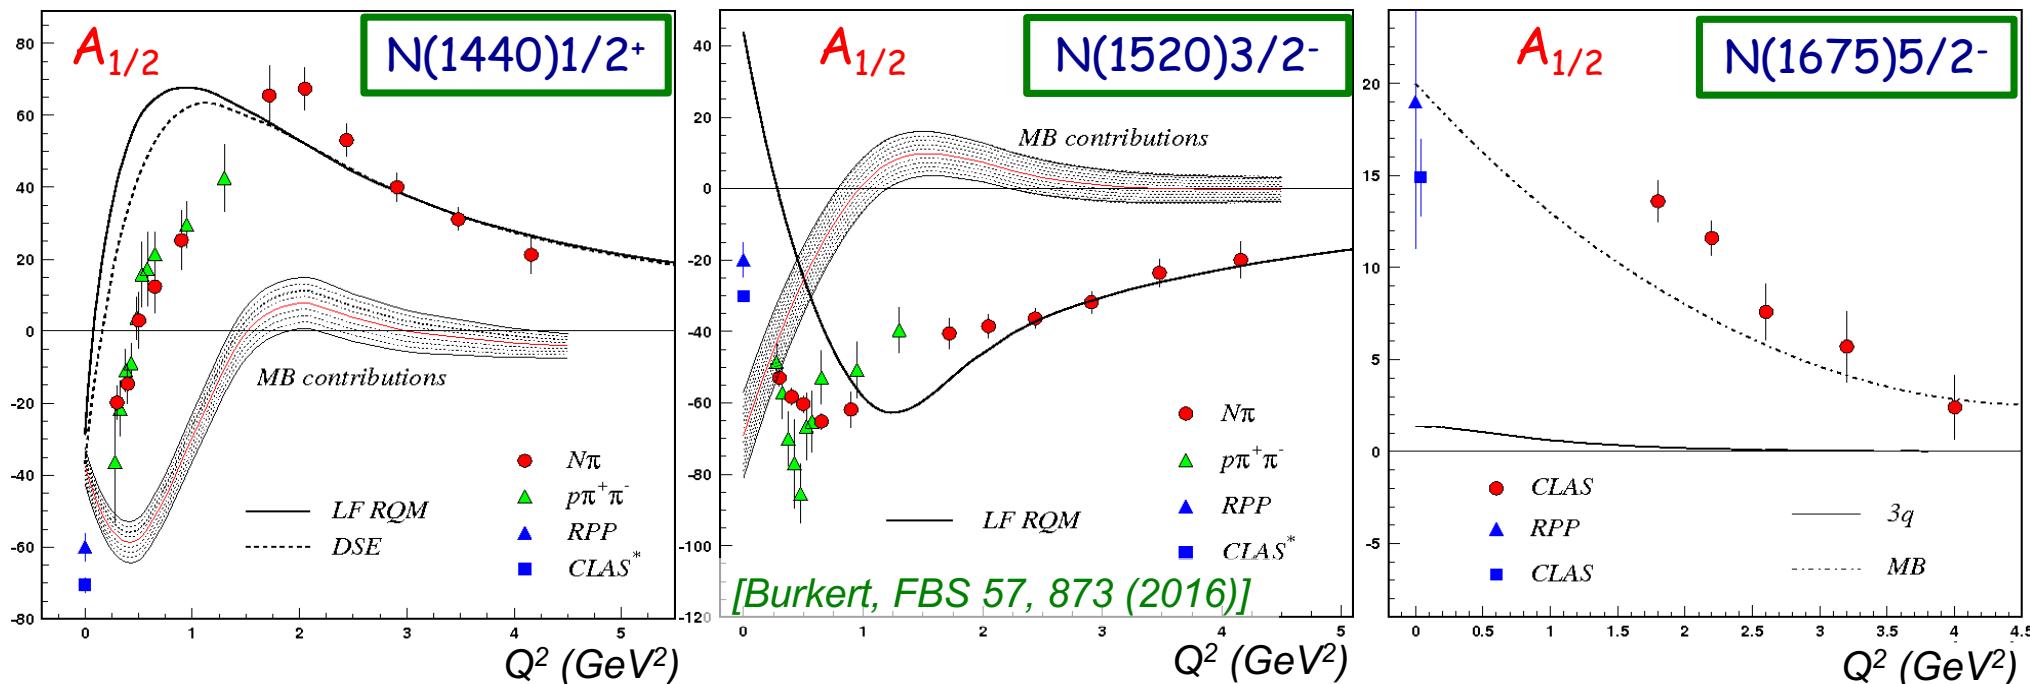

- Good agreement between UIM and DR approaches

[Aznauryan et al., PRC 80, 055203 (2009)]

Low-Lying N* States

- Electrocoupings reveal different interplay between quark core and M-B cloud
 - *Important to study different N^* states vs. distance scale*
- Good agreement of the extracted N^* electrocouplings from $N\pi$ and $N\pi\pi$
 - *Compelling evidence for the reliability of the results*
 - *Channels have very different mechanisms for the non-resonant background*

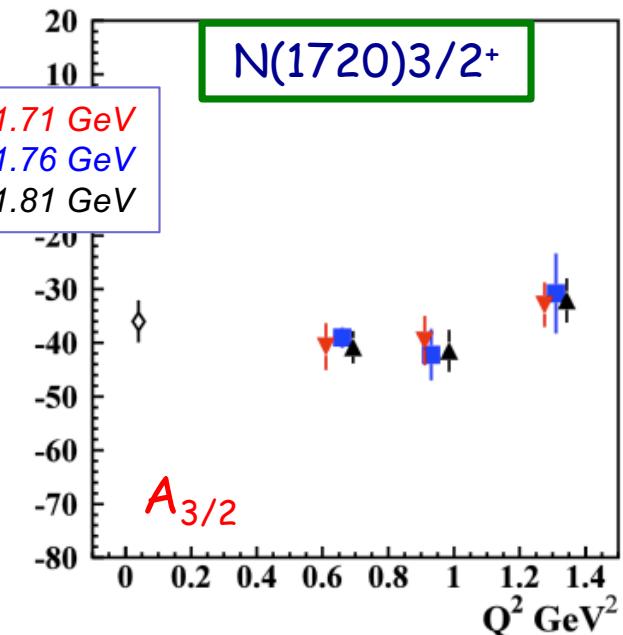

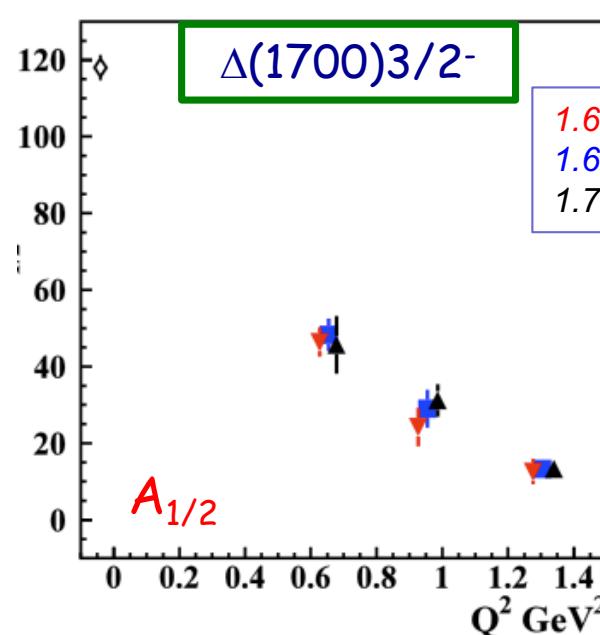

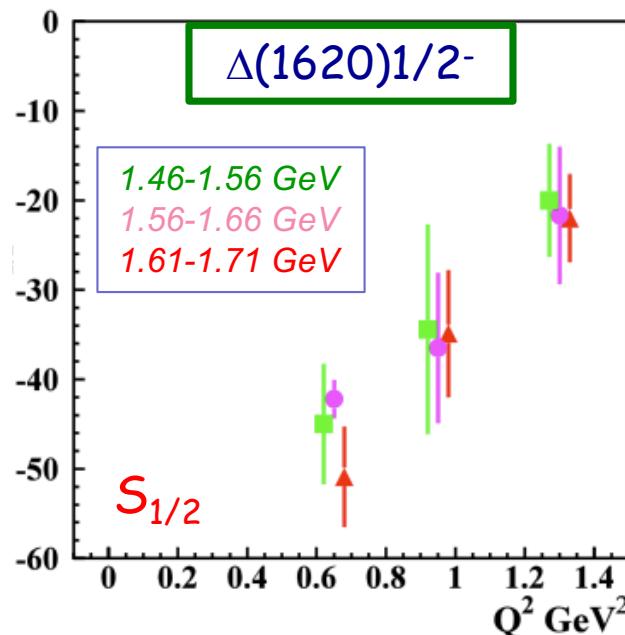

Structure studies of low-lying N^* states have advanced due to agreement of results from independent analyses of the $N\pi$ and $N\pi\pi$ final states

Higher-Lying N* States

- $N\pi\pi$ channel gave first electrocoupling results on higher-lying states up to 1.7 GeV:

$$\Delta(1620)1/2^-, N(1650)1/2^-, \Delta(1700)3/2^-, N(1720)3/2^+$$

Note: Most high-lying N states ($M > 1.6$ GeV) decay mainly to $N\pi\pi$ with much smaller strength to $N\pi$*

[Mokek, Aznauryan, Int. J. Mod. Phys. Conf. Ser. 26, 1460080 (2014)]

Data from the KY channels is critical to provide an independent extraction of the electrocoupling amplitudes for the high-lying N* states

Extend these studies to electroproduction and to higher masses

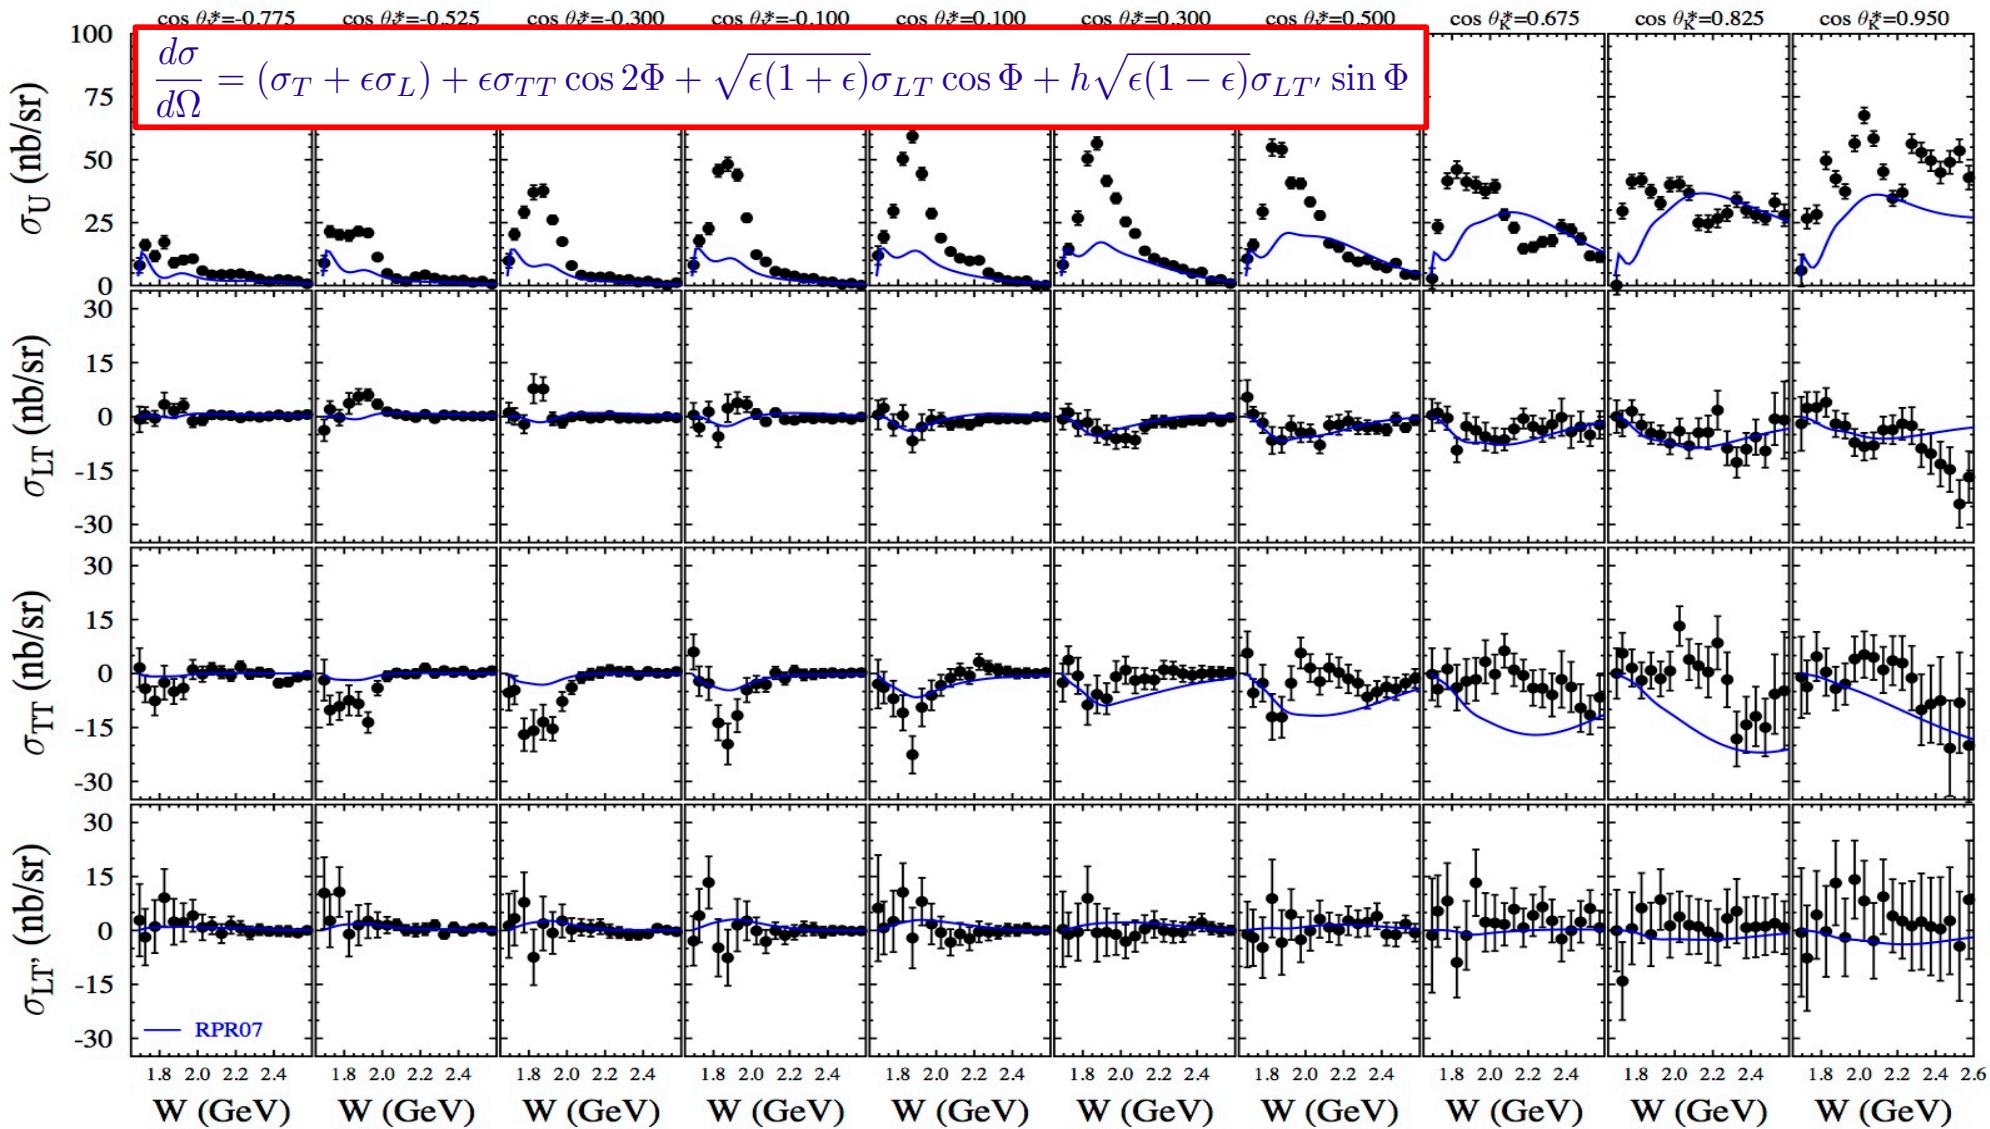

K⁺Λ Structure Functions

$E = 5.5 \text{ GeV}, \quad W: \text{thr} - 2.6 \text{ GeV}, \quad Q^2 = [1.80, 2.60, 3.45 \text{ GeV}^2]$

[Carman et al., PRC 87, 025204 (2013)]

K⁺Σ⁰ Structure Functions

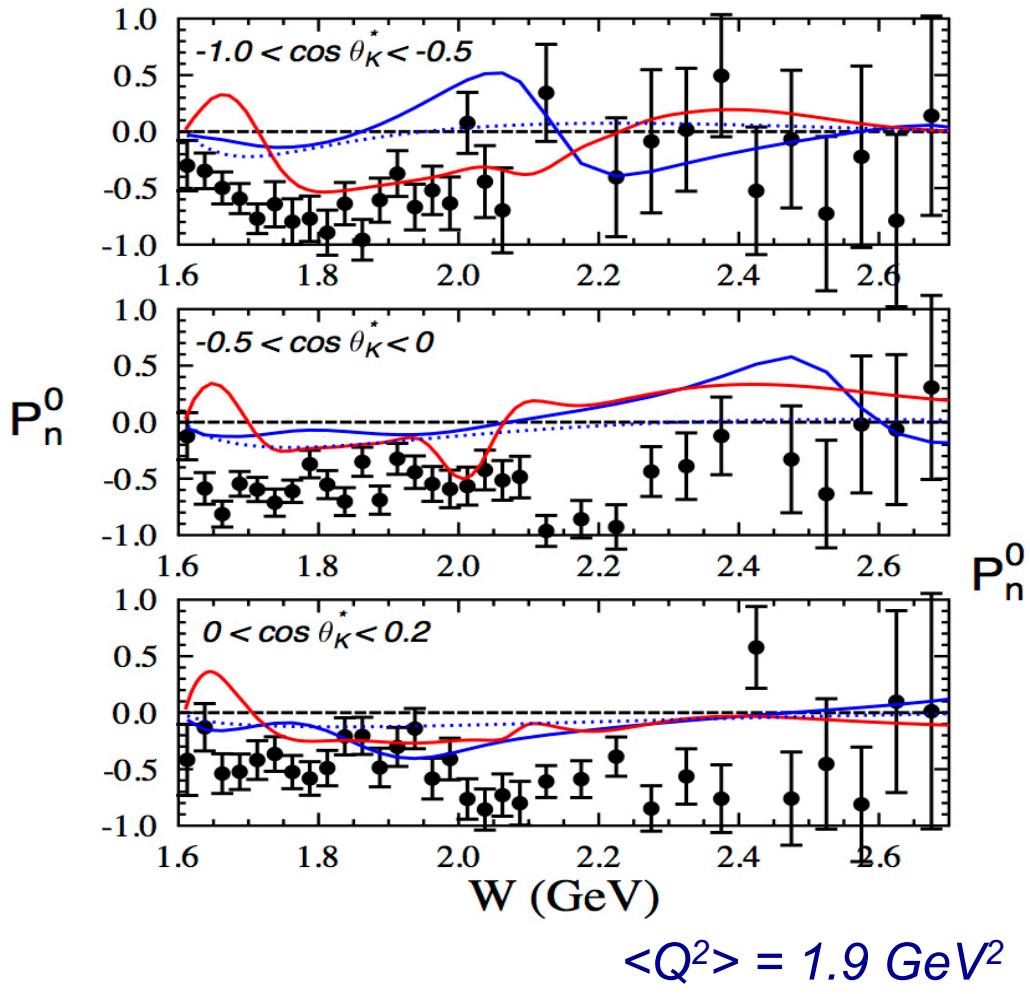

$E = 5.5 \text{ GeV}$, $W: \text{thr} - 2.6 \text{ GeV}$, $Q^2 = [1.80, 2.60, 3.45 \text{ GeV}^2]$

[Carman et al., PRC 87, 025204 (2013)]

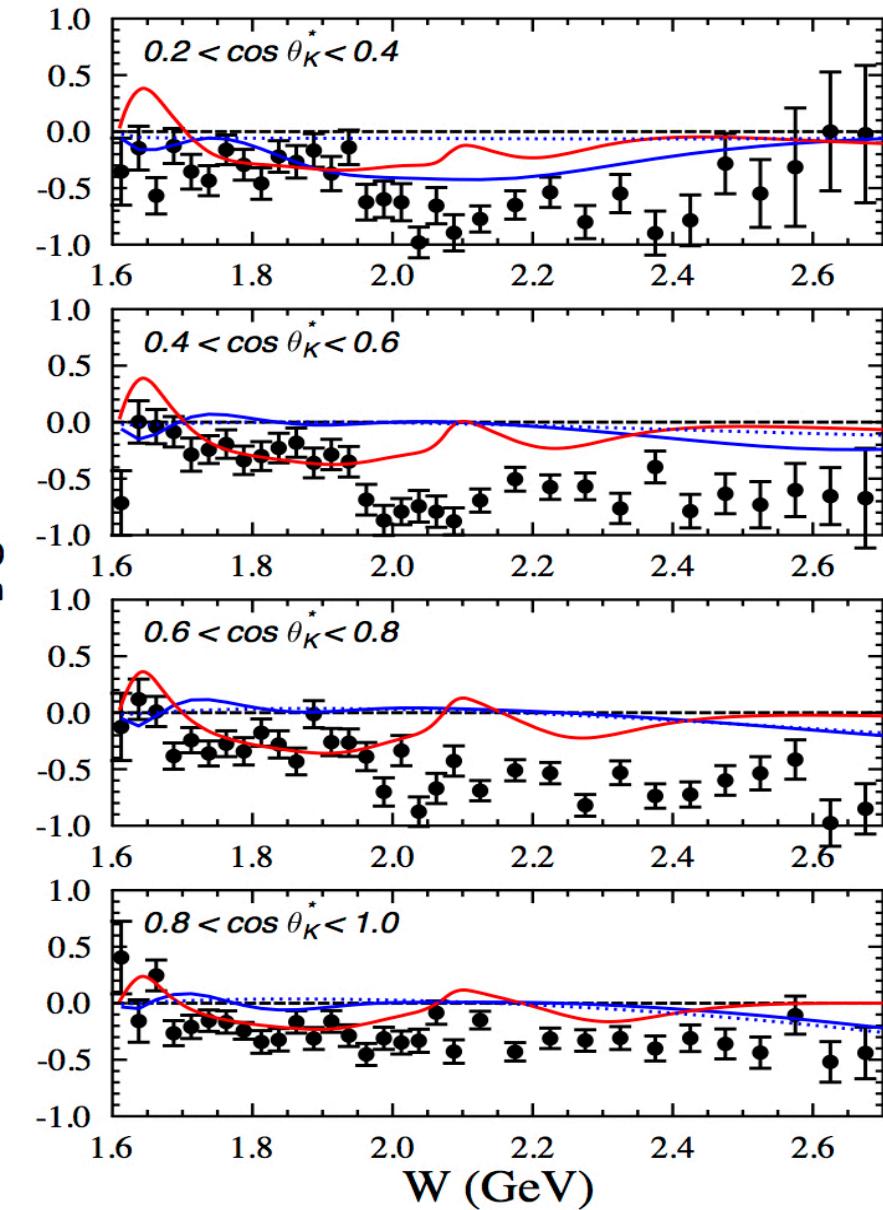

Recoil Polarization

$e p \rightarrow e' K^+ \bar{\Lambda}$

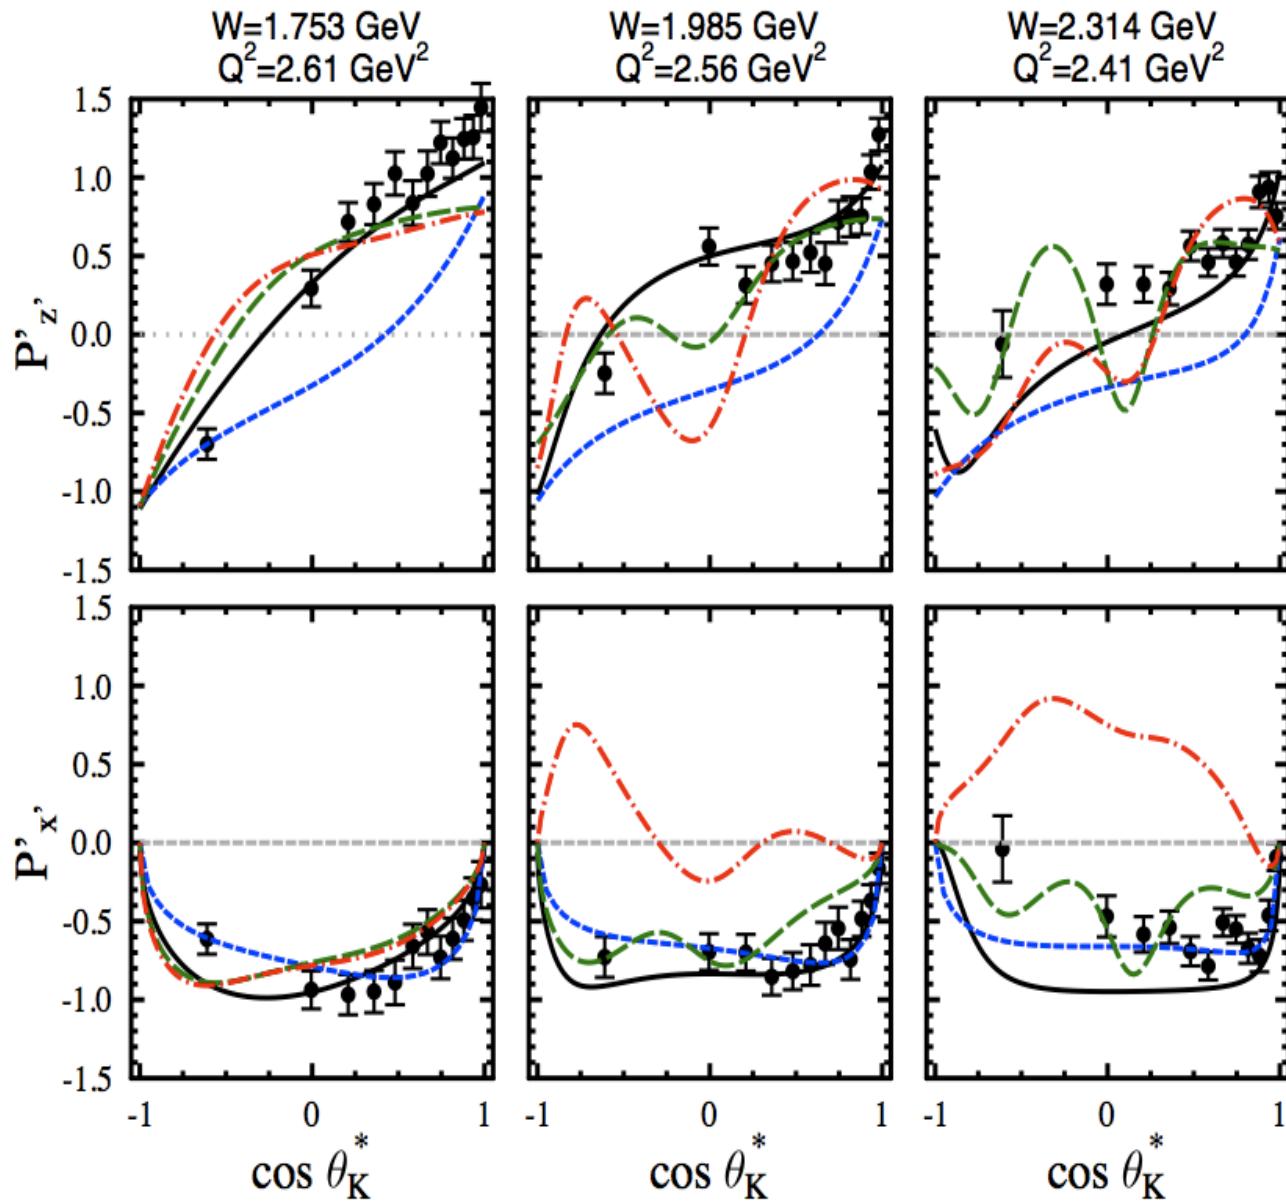

MX, RPR-2011 (full) —
(nores)

[Gabrielyan et al., PRC 90, 035202 (2014)]

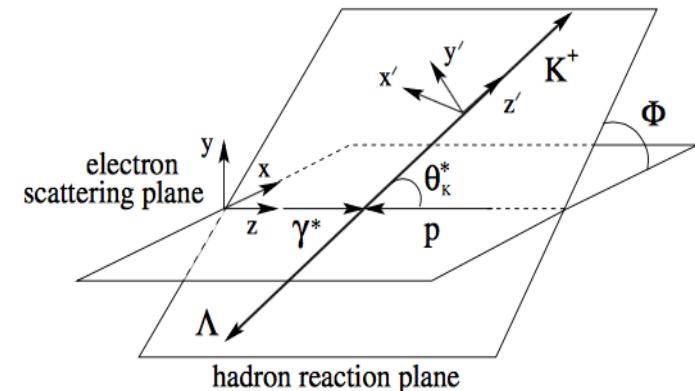

Transferred Polarization

$\overline{e}p \rightarrow e' K^+ \bar{\Lambda}$

5.754 GeV
Summed over Q^2, Φ

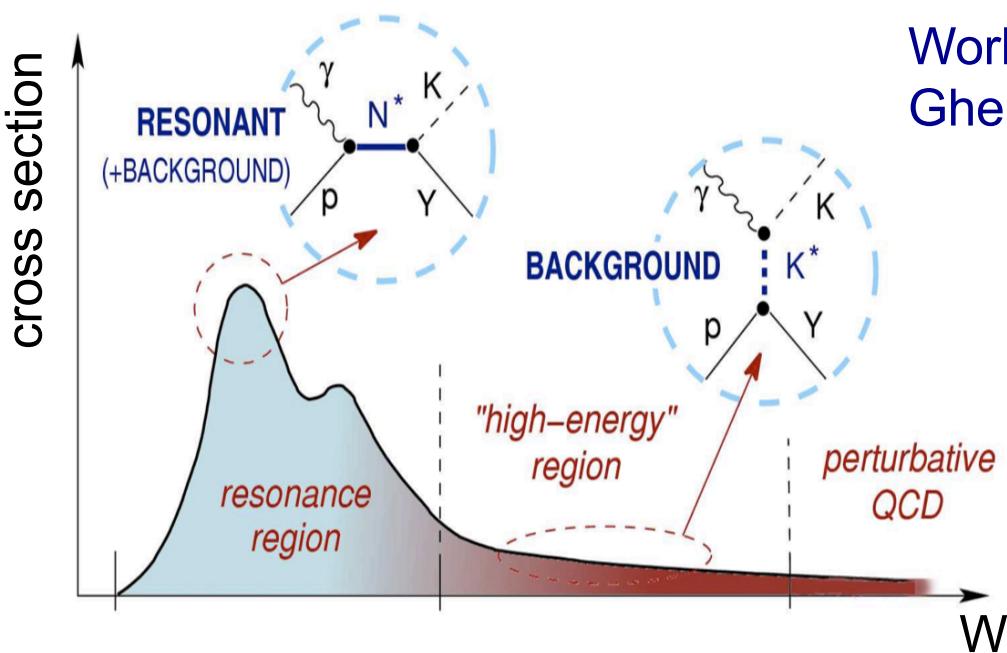

Isobar Model - Mart
Regge Model - GLV
RPR07 w $P_{11}(1900)$
RPR07 w $D_{13}(1900)$

[Carman et al., PRC 79, 065205 (2009)]

KY Reaction Model

There is an *urgent* need for KY reaction models - first for lower Q^2 data from CLAS and then for higher Q^2 data from CLAS12

Work is underway to further develop the Ghent Regge plus Resonance (RPR) model:

- Update RPR electrocoupling parameters
- Refit model to CLAS γp and $\gamma_v p$ data:
 $W \rightarrow 2.6 \text{ GeV}, Q^2 \rightarrow 4 \text{ GeV}^2$
- Extend model to CLAS12 kinematics:
 $W \rightarrow 3 \text{ GeV}, Q^2 \rightarrow 12 \text{ GeV}^2$

[DeCruz et al., PRC 86, 015212 (2012)]

Ultimately need analysis within global multi-channel electroproduction model
(e.g. ANL-Osaka, Bonn-Gatchina, JPAC@JLab) - getting underway now

CLAS12 Spectrometer

Physics program begins this year

CLAS12 Specifications

	Forward	Central
Angular coverage	$5^\circ - 35^\circ$	$35^\circ - 135^\circ$
Momentum resolution	$\delta p/p < 1\%$	$\delta p/p < 5\%$
θ resolution	1 mrad	5 – 10 mrad
ϕ resolution	1 mrad/ $\sin\theta$	5 mrad/ $\sin\theta$
PID:		
π/K	4σ to 2.8 GeV	3σ to 0.6 GeV
K/p	4σ to 4.8 GeV	3σ to 1.0 GeV
π/p	4σ to 5.4 GeV	3σ to 1.2 GeV
Calorimeter resolution	$\sigma_E \sim 0.1\sqrt{E}$	
Luminosity	$10^{35} \text{ cm}^{-2}\text{s}^{-1}$	

CLAS12 N* Program

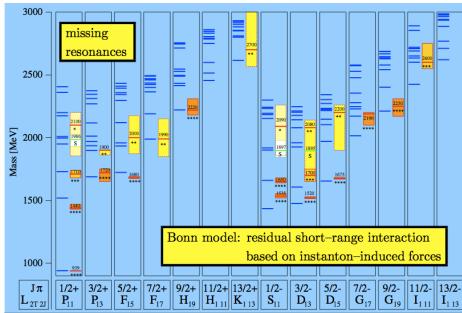

E12-09-003	Nucleon Resonance Studies with CLAS12
E12-06-108A	KY Electroproduction with CLAS12
E12-16-010A	N* Studies Via KY Electroproduction at 6.6 and 8.8 GeV

- Measure exclusive electroproduction of $N\pi$, $N\eta$, $N\pi\pi$, KY final states from an unpolarized proton target with longitudinally polarized electron beam

$$E_b = 6.6, 8.8, 11 \text{ GeV}, Q^2 = 2 \rightarrow 12 \text{ GeV}^2, W \rightarrow 3.0 \text{ GeV}, \cos \theta_m^* = [-1:1]$$

- Study spectrum and structure of all prominent N^* states vs. Q^2
 - A unique opportunity to explore the nature of confinement that is responsible for the dominant part of N^* masses and the emergence of N^* states from QCD
- The independent analysis of $N\pi$, $N\eta$, $N\pi\pi$, and KY allows for “model independent” extraction of the electrocoupling amplitudes
 - At moderate Q^2 (1 - 5 GeV 2), the new CLAS12 electroproduction data will be of comparable statistical quality as existing CLAS photoproduction data

N* Spectrum and Structure

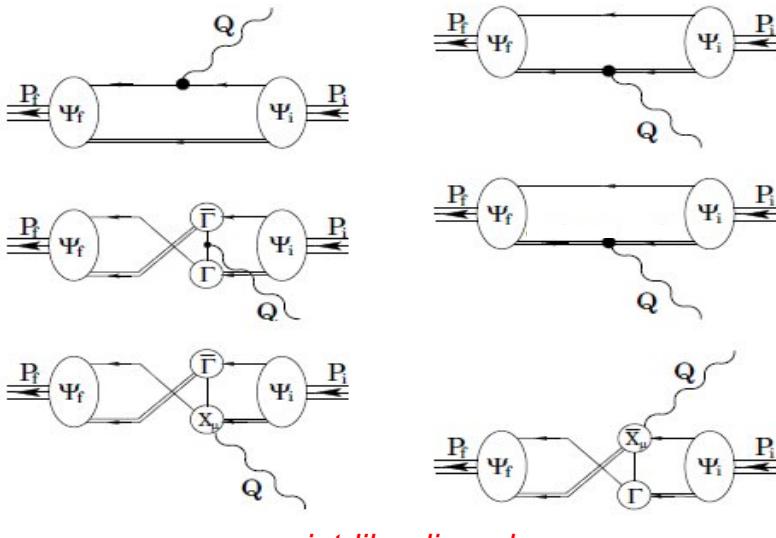

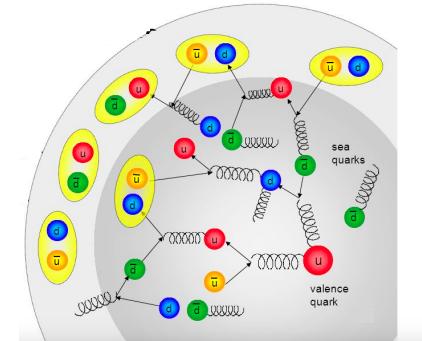

Study higher-lying states in N* spectrum:

- important precision tests to confirm signals of new baryon states observed in KY photoproduction
- require consistency between photo- and electroproduction data

Understand the effect of N* structure from M-B cloud:

- use transition regime to explore the emergence of the external M-B cloud from the core of confined quarks and gluons
- check the theoretical expectations on the M-B cloud generation from the confinement regime

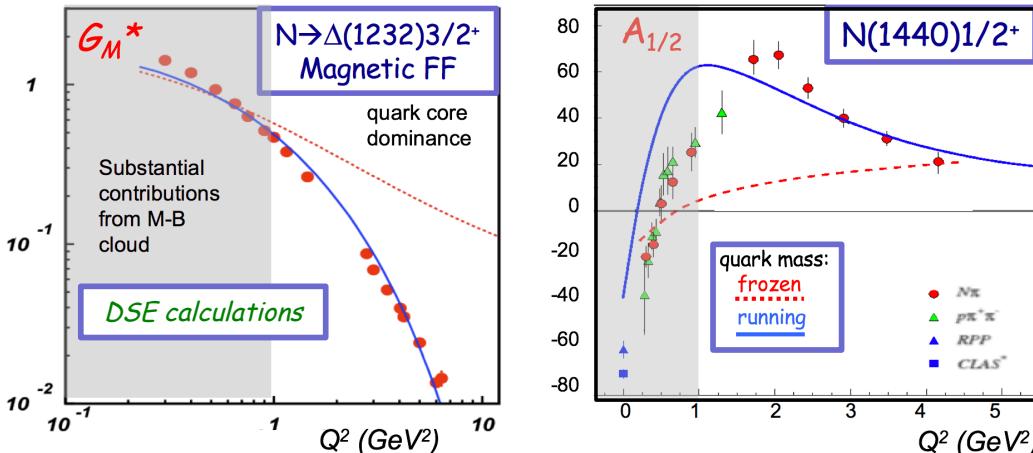

non-point-like diquarks

Access di-quark correlations in N* structure:

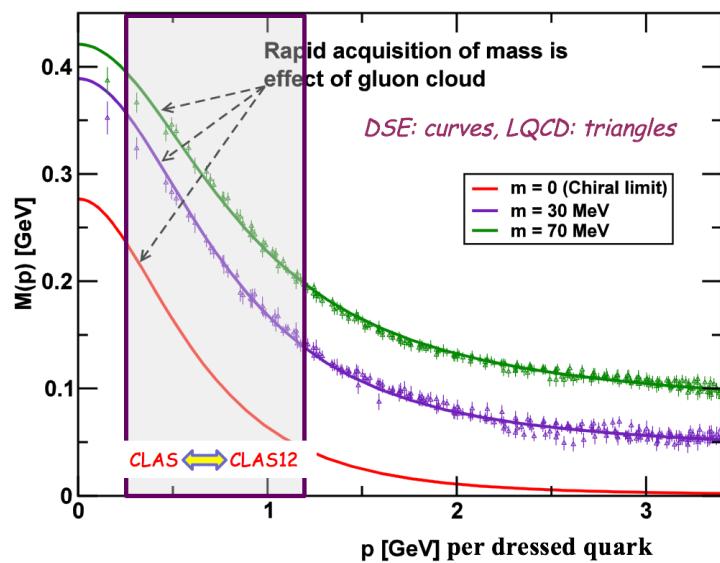

- important part of N* structure and $\gamma_v NN^*$ transition amplitudes
- determined by dressed quark mass function through DCSB
- dependent on N* quantum numbers
- sizable for $Q^2 < 5 \text{ GeV}^2$; reduced contributions from M-B cloud in range from $Q^2 = 2 \rightarrow 5 \text{ GeV}^2$

Exploring Hadron Mass Generation

Dressed quark mass function:

- *DSE calculations of FFs for N^* states can test the relevance of dressed quarks with dynamically generated masses*
- *The mass function can be “measured” as it influences and determines the electrocoupling amplitudes*

Open questions in Standard Model:

- *Data spanning the transition region from low to high Q^2 can help to map out the momentum-dependent dressed quark mass*
- *These dynamical contributions account for more than 98% of the dressed quark mass*
- *Help to address the essence of confinement, mass generation, and its distribution within hadrons*

Concluding Remarks

- The study of N^* states is one of the key foundations of the Hall B physics program with CLAS:
 - CLAS has provided a huge amount of precision data (cross sections and pol. observables) for the $N\pi$, $N\eta$, KY, and $N\pi\pi$ channels Q^2 from 0 to 4.5 GeV^2
 - Electrocouplings of most N^* states $< 1.7 \text{ GeV}$ have been extracted from these data for the first time for the non-strange M-B final states
 - Analysis tools to extract the structure information from the KY experimental observables are sorely needed
- The CLAS12 N^* program will extend these studies for $2 < Q^2 < 12 \text{ GeV}^2$:
 - These studies will allow for insight into the strong interaction dynamics of dressed quarks and their confinement in baryons over a broad Q^2 range
 - These data will address the most challenging problems of the SM on the nature of hadron mass, confinement, and the emergence of N^* states
