# How do the Ground/Excited State Nucleon Masses Emerge?

## Composition of the Nucleon Mass:

$M_p$ , MeV (PDG20)

938.2720813  
 $\pm 0.0000058$

Sum of bare quark  
masses, MeV

$2.16 + 2.16 + 4.67$   
 $= 8.99^{+1.45}_{-0.65}$  or  $< 1.1\%$

proton

$M_n$ , MeV (PDG20)

939.5654133  
 $\pm 0.0000058$

Sum of bare quark  
masses, MeV

$4.67 + 4.67 + 2.16$   
 $= 11.50^{+1.45}_{-0.60}$  or  $< 1.4\%$

neutron

- Higgs mechanism generates the masses of bare quarks
- Dominant part of nucleon mass is generated in processes other than the Higgs mechanism

**The Continuum Schwinger method (CSM) has conclusively demonstrated that the dominant part of hadron mass is generated by the strong interaction in the regime when the QCD running coupling becomes comparable with unity, the so-called strong QCD regime**

# Basics for Insight into EHM: Continuum Schwinger Methods (CSM)

## Emergence of Dressed Quarks and Gluons

D. Binosi, Few Body Syst. 63, 2 (2022)

## QCD Running Coupling $\alpha(k)$

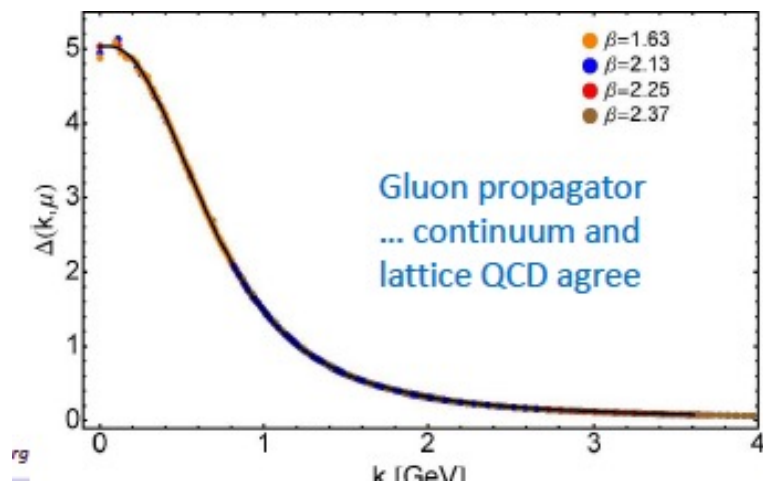

Zh-F. Cui et al., Chin. Phys. C44, 083102 (2020)

In the regime of the QCD running coupling comparable with unity, the dressed quarks and gluons with distance (momentum) dependent masses emerge from QCD, as follows from the equations of the motion for the QCD fields depicted above.

# Basics for Insight into EHM: Continuum and Lattice QCD Synergy

- Express the fundamental feature: emergence of the quark and gluon masses even in the case of massless quarks in the chiral limit and massless QCD gluons
- Continuum QCD results get support from LQCD
- Insight into dressed quark mass function from data on hadron structure represents a challenge for experimental hadron physics

**Dressed Quark/Gluon Masses (continuum QCD)**  
C.D. Roberts, Symmetry 12, 1468 (2020)

Inferred from QCD Lagrangian with only  $\Lambda_{\text{QCD}}$  parameter

Pion Elastic FF

Pion PDF

Dressed Quark/Gluon Running Masses

- Insight into the dressed quark/gluon running masses from the experimental results within the continuum QCD approach

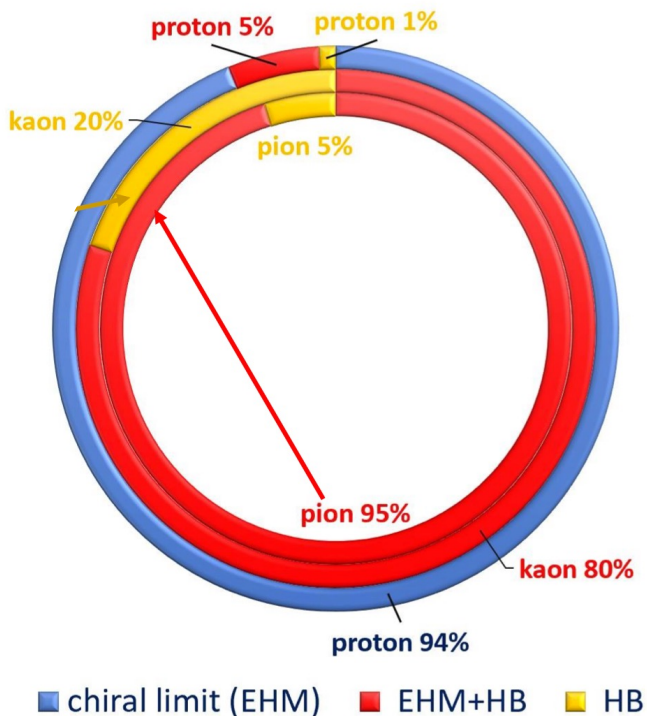

- The model and renormalization scheme/scale independent Goldberger-Treiman relations connect the momentum dependence of the dressed quark mass to the pion/kaon Bethe-Salpeter amplitudes, making the studies of pion and kaon structure a promising way to map out the momentum dependence of the dressed quark mass.

$$f_{\pi} E_{\pi}(p^2) = B(p^2)$$

- Pions and kaons are simultaneously  $q\bar{q}$  bound states and Goldstone bosons in chiral symmetry breaking. Their masses should be reduced to zero in the chiral limit and, in the real world, down to small values in comparison with the hadron mass scale owing to DCSB.

# Insight into EHM from the Data on N/N\* Structure

## Mass Budgets

- Studies of  $\pi/K$  structure elucidate the interference between emergent and Higgs mechanisms in EHM
- Studies of ground/excited state nucleon structure allow us to explore the dressed quark mass function in a different environment where the sum of dressed quark masses is the dominant contribution to the physical masses of these states, offering insight into emergent mechanisms

- Consistent results on the momentum dependence of the dressed quark mass function from independent studies of the pseudoscalar mesons and the ground and excited state nucleon structure are of particular importance for the validation of insight into EHM.

## Composition of low-lying $J = \frac{3}{2}^{\pm}$ $\Delta$ -baryons

Langtian Liu (Nanjing U.), Chen Chen (Hefei, CUST and PCFT, Hefei), Ya Lu (Nanjing U.), Craig D. Roberts (Nanjing U.), Jorge Segovia (Nanjing U. and Pablo de Olavide U., Seville)

Mar 22, 2022

13 pages

e-Print: [2203.12083](#) [hep-ph]

Report number: NJU-INP 057/22, USTC-ICTS/PCFT-22-11

Exposing orbital angular momentum structure of, e.g.,  $\Delta(1700) \frac{3}{2}^{-}$  ... providing motivation and support for extensive baryon resonance programme at JLab

## *Electroexcitation of baryon resonances*

- *The ground state proton is not enough*
- Ground state of the hydrogen atom did not give us QED
- Studies of the proton alone cannot reveal all the wonders of QCD, if QCD is truly the theory of strong interactions in the Standard Model
- Modern and planned high-luminosity facilities provide unprecedented opportunities to move beyond the 100-year focus on the structure of just one (or two = neutron) hadron(s)
- How much richer will be our store of knowledge once insights into the full array of Nature's hadrons is in our hands!
- Poincaré-covariant Faddeev equation is shedding new light on the structure of ALL baryons

**A unique opportunity to explore either universality or the environmental sensitivity of the dressed quark mass function**

# N\* Photo-/Electroexcitation Amplitudes ( $\gamma_{r,v}pN^*$ Photo-/Electrocouplings) and their Extraction from Exclusive Photo-/Electroproduction Data

- Real  $A_{1/2}(Q^2)$ ,  $A_{3/2}(Q^2)$ ,  $S_{1/2}(Q^2)$

I.G. Aznauryan and V.D. Burkert,  
Prog. Part. Nucl. Phys. 67, 1 (2012)

Definition of  $N^*$  photo-/electrocouplings employed in CLAS data analyses:

$$\Gamma_\gamma = \frac{k_{\gamma_{N^*}}^2}{\pi} \frac{2M_N}{(2J_r + 1)M_{N^*}} \left[ |A_{1/2}|^2 + |A_{3/2}|^2 \right]$$

- Consistent results on the  $\gamma_{r,v}pN^*$  photo-/electrocouplings from different meson photo-/electro-production channels allow us to validate reliable extraction of these quantities

# Summary of Published CLAS Data on Exclusive Meson Electroproduction off Protons in N\* Excitation Region

Hadronic final state	Covered W-range, GeV	Covered Q <sup>2</sup> -range, GeV <sup>2</sup>	Measured observables
$\pi^+n$	1.1-1.38 1.1-1.55 1.1-1.70 1.6-2.00	0.16-0.36 0.3-0.6 1.7-4.5 1.8-4.5	$d\sigma/d\Omega$ $d\sigma/d\Omega$ $d\sigma/d\Omega, A_b$ $d\sigma/d\Omega$

- $d\sigma/d\Omega$ —CM angular distributions
- $A_b, A_t, A_{bt}$ —longitudinal beam, target, and beam-target asymmetries
- $P^0, P'$ —recoil and transferred polarization of strange baryon

**Over 150,000 data points!**

**Almost full coverage of the final state hadron phase space**

The measured observables from CLAS are stored in the CLAS Physics Data Base <http://clas.sinp.msu.ru/cgi-bin/jlab/db.cgi>

# Nucleon Resonance Electrocouplings from Data on Exclusive Meson Electroproduction with CLAS

Exclusive meson electroproduction channels	Excited proton states	$Q^2$ -ranges for extracted $\gamma_{\nu}pN^*$ electrocouplings, $\text{GeV}^2$
$\pi^0 p, \pi^+ n$	$\Delta(1232)3/2^+$	0.16-6.0
	$N(1440)1/2^+, N(1520)3/2^-, N(1535)1/2^-$	0.30-4.16
$\pi^+ n$	$N(1675)5/2^-, N(1680)5/2^+, N(1710)1/2^+$	1.6-4.5
$\eta p$	$N(1535)1/2^-$	0.2-2.9
$\pi^+ \pi^- p$	$N(1440)1/2^+, N(1520)3/2^-$	0.25-1.50
	$\Delta(1620)1/2^-, N(1650)1/2^-, N(1680)5/2^+, \Delta(1700)3/2^-, N(1720)3/2^+, N'(1720)3/2^+$	2.0-5.0 (preliminary) 0.5-1.5

- The  $N^*$  electroexcitation amplitudes ( $\gamma_{\nu}pN^*$  electrocouplings) have become available in a broad range of  $Q^2 < 5.0 \text{ GeV}^2$
- In the mass range  $W < 1.6 \text{ GeV}$  the  $\gamma_{\nu}pN^*$  electrocoupling were obtained from independent studies of  $\pi N$ ,  $\eta p$ , and  $\pi^+ \pi^- p$  electroproduction

Recent results can be found in: [A.N. Hiller Blin et al, PRC100, 035201 \(2019\)](#)

# Insight to EHM From Resonance Electrocouplings

## Dyson-Schwinger Equations (DSE):

- J. Segovia et al., PRL 115, 171801 (2015)
- J. Segovia et al., Few Body Syst. 55, 1185 (2014)

Good data description at  $Q^2 > 2 \text{ GeV}^2$  achieved with the same dressed quark mass function for the ground pion/nucleon and two excited nucleon states of distinctively different structure **validates the Continuum Schwinger Method (CSM) results on the momentum dependence of the dressed quark mass**. The  $\gamma_p N^*$  electrocoupling data shed light on the strong QCD dynamics underlying hadron mass generation.

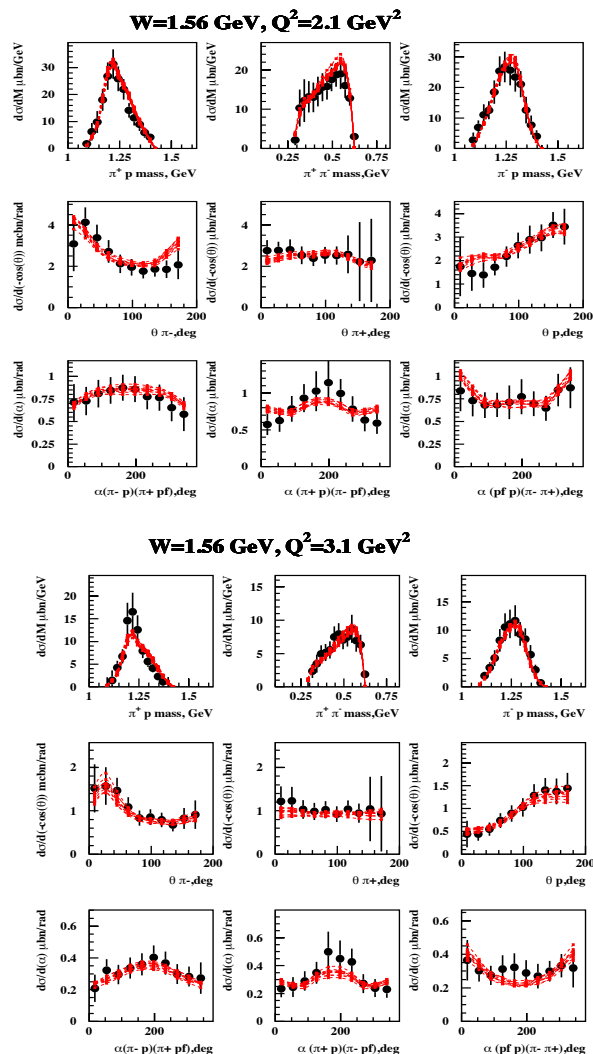

**One of the most important achievements in hadron physics of the last decade in synergistic efforts between experimentalists, phenomenologists, and theorists.**

# Electrocouplings of the $\Delta(1600)3/2^+$ : CSM prediction vs. Data Determination

Extraction of  $\Delta(1600)3/2^+$  electrocouplings from the CLAS  $\pi^+\pi^-p$  electroproduction data at  $2 \text{ GeV}^2 < Q^2 < 5 \text{ GeV}^2$  within the JM reaction model, January-March, 2022

Parameter-free CSM predictions for  $\Delta(1600)3/2^+$  electrocouplings  
Ya Lu et al., Phys. Rev. D 100, 034001 (2019)

# N(1440)1/2<sup>+</sup> Parameters from $\pi^+\pi^-p$ Data at $2 < Q^2 < 5 \text{ GeV}^2$

 in red:  $3.0 < Q^2 < 5.0$  GeV<sup>2</sup>

— continuum QCD predictions, Ya Lu et al., Phys. Rev. D 100, 034001 (2019)

CLAS results on  $\Delta(1600)3/2^+$  electrocouplings confirmed the CSM prediction solidifying evidence for insight into dressed quark mass function and, consequently, into EHM !

# Emergence of Hadron Mass from the Data with CLAS12

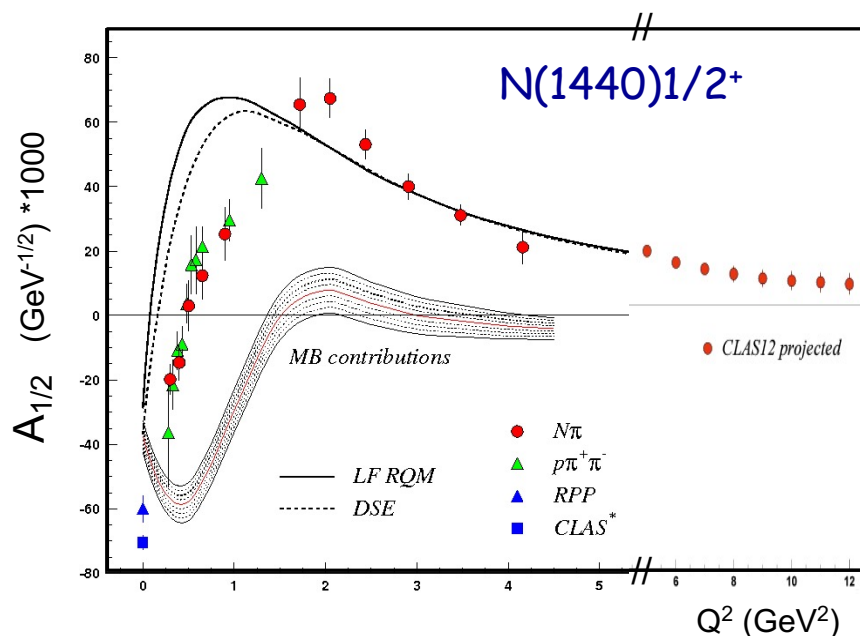

**N\*** electroexcitation studies at JLab during **and after 12 GeV era** will address the critical questions:

*How is >98% of visible mass generated?*

*How does confinement emerge from QCD and how is it related to Dynamical Chiral Symmetry Breaking?*

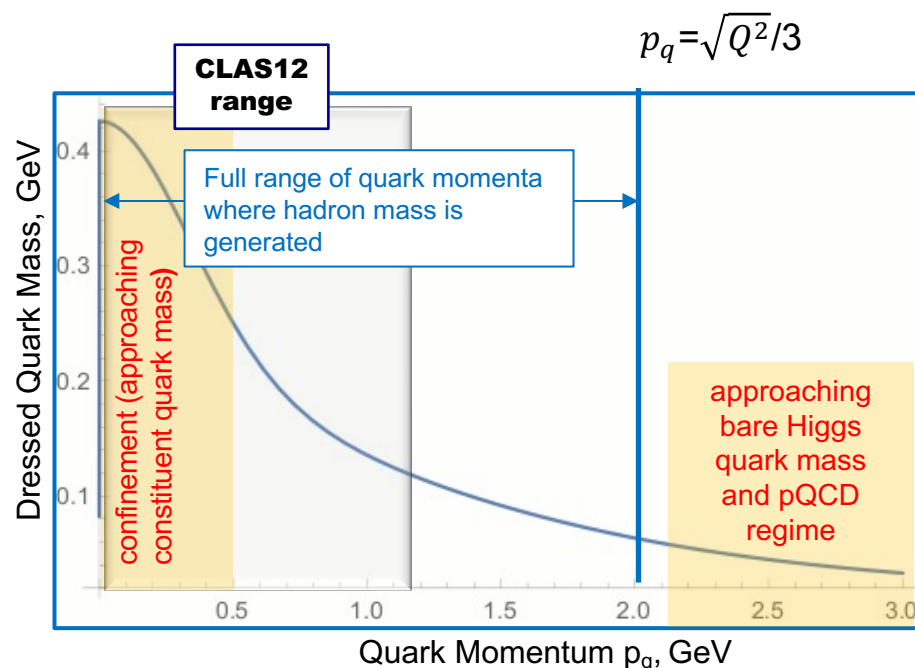

*(S.J, Brodsky et al., Int. J. Mod. Phys. Rev. E29, 2030006 (2020))*

**Mapping-out quark mass function from the results on  $\gamma_v p N^*$  electrocouplings of spin-isospin flip, radial, and orbital excited nucleon resonances at  $5 < Q^2 < 36 \text{ GeV}^2$  is needed to explore the full range of distances where the dominant part of hadron mass is generated**

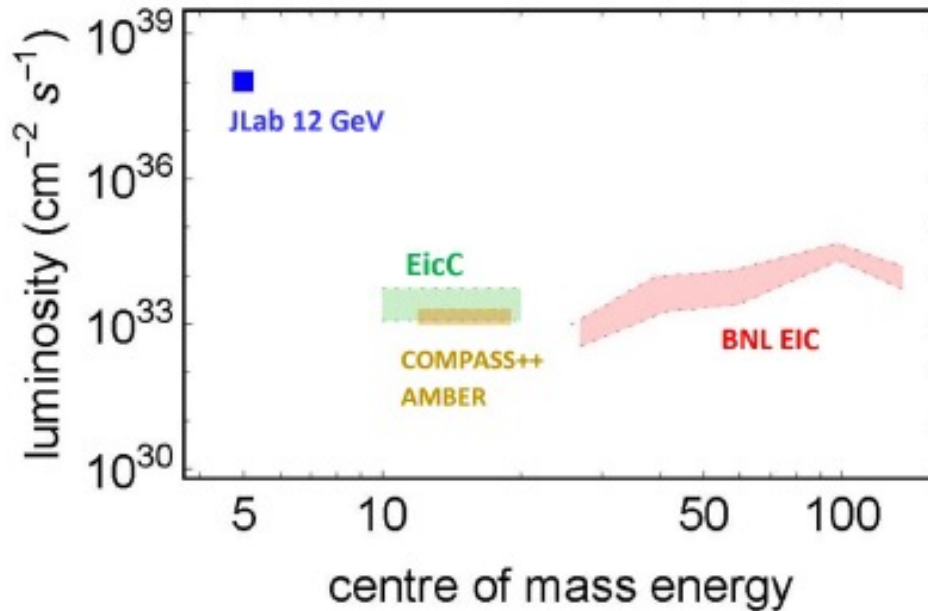

CLAS results vs. theory expectations with running quark mass

Access to the dressed quark/hadron mass generation

# Studies of $\gamma_p N^*$ Electrocouplings at $Q^2 > 10 \text{ GeV}^2$

Energy and luminosity increase up to  $>10^{36} \text{ cm}^{-2}\text{s}^{-1}$  are needed in order to obtain information on the  $\gamma_p N^*$  electrocouplings at  $Q^2 > 10 \text{ GeV}^2$ , allowing us to map out the momentum dependence of the dressed quark mass within the entire range of distances where the dominant part of hadron mass is generated

Both EicC and EIC would need much higher, unlikely feasible luminosity

The exclusive electroproduction measurements foreseen at JLab after completion of the 12 GeV program:

- Beam energy at fixed target: 24 GeV
- Nearly  $4\pi$  coverage
- High luminosity

**Offer maximal achievable luminosity for extraction of  $\gamma_p N^*$  electrocouplings at  $Q^2 > 10 \text{ GeV}^2$**

# Conclusions and Outlook

- EHM paradigm makes a broad array of predictions. Those for  $N/N^*$  structure are worth testing to gain insight and understanding of hadron mass generation by mapping the momentum dependence of the dressed quark running masses.
- The CLAS detector provided the dominant part of the data on most exclusive meson electroproduction channels in the resonance region. These high-quality data have allowed us to determine the electrocouplings of most resonances in the mass range up to 1.8 GeV with consistent results from analyses of the  $\pi^+n$ ,  $\pi^0p$ ,  $\eta p$ , and  $\pi^+\pi^-p$  channels offering the experimental input needed for the validation of all available and foreseen approaches for the description of hadron mass.
- A good description of CLAS results on the  $\Delta(1232)3/2^+$  and  $N(1440)1/2^+$  electro-excitation amplitudes achieved with the same dressed quark mass function as used previously in the successful evaluations of the elastic ground nucleon and pion form factors, and the pion PDF validates insight into the dynamics that underlie the emergence of hadron mass.
- The CSM parameter-free predictions on the  $\Delta(1600)3/2^+$  electrocouplings obtained within the same framework as for the above-mentioned resonances have been confirmed by the first preliminary results on the electrocouplings of this state from  $\pi^+\pi^-p$  electroproduction data. Combined with the successful description of the hadron structure observables mentioned above, these results offer overwhelming evidence in support of the CSM concept for EHM.

# Conclusions and Outlook

- CLAS12 is the only facility in the world capable of obtaining the electrocouplings of all prominent  $N^*$  states at the still unexplored ranges of the highest  $Q^2$  for exclusive reactions from  $5 \text{ GeV}^2$  to  $12 \text{ GeV}^2$  from measurements of  $N\pi$ ,  $\pi^+\pi^-p$ , and  $KY$  electroproduction, allowing us to map out the dressed quark mass function at quark momenta  $< 1.3 \text{ GeV}$ .
- Extension of the results on the  $\gamma_v p N^*$  electrocouplings into the  $Q^2$  range from  $10 \text{ GeV}^2$  to  $36 \text{ GeV}^2$  from the measurements of exclusive meson electroproduction after the future JLab upgrade with  $24 \text{ GeV}$  beam energy and luminosity  $> 10^{36} \text{ cm}^{-2}\text{s}^{-1}$  will provide information on the dressed quark mass function at the full range of distances where the dominant part of hadron mass is generated, addressing the most challenging problems of the Standard Model on the nature of  $>98\%$  of hadron mass, quark-gluon confinement, and the emergence of the  $N^*$  structure from QCD. It will make the future JLab at high energy/luminosity the ultimate QCD machine.
- CSM approach is capable to predict the observables which describe the pion and kaon structure from the results on exploration of the ground and excited nucleon state structure and forge synergistic efforts between JLab and AMBER@CERN, EIC, EicC on gaining insight into the nature of hadron mass.

# Back up

## N\* Structure in Experiments with CLAS/CLAS12

The experimental program on the studies of N\* structure in exclusive meson photo-/electroproduction with CLAS/CLAS12 seeks to determine:

- $\gamma_v p N^*$  electrocouplings at photon virtualities up to 10 GeV<sup>2</sup> for most of the excited proton states through analyzing the major meson electroproduction channels from CLAS/CLAS12 data
- Explore hadron mass emergence (EHM) and elucidate the trace anomaly by mapping out the dynamical quark mass in the transition from almost massless pQCD quarks to fully dressed constituent quarks

**An important part of the efforts on the exploration of strong QCD from the data of the experiments with electromagnetic probes:**

1. S.J. Brodsky et al., Int. J. Mod. Phys. E29, 203006 (2020).
2. C.D. Roberts, Symmetry 12, 1468 (2020).
3. M. Barabanov et al., Prog. Part. Nucl. Phys. 103835 (2021).

**A unique source of information on many facets of strong QCD in generating excited nucleon states with different structural features:**

1. I.G. Aznauryan and V.D. Burkert, Prog. Part. Nucl. Phys. 67, 1 (2012).
2. D.S. Carman, K. Joo, and V.I. Mokeev, Few Body Syst. 61, 29 (2020).
3. V.D. Burkert and C.D. Roberts, Rev. Mod. Phys. 91, 011003 (2019).

# Electrocouplings of $N(1440)1/2^+$ from $\pi N$ and $\pi^+\pi^-p$ Electroproduction off Proton Data

Consistent results on  $N(1440)1/2^+$  electrocouplings from independent studies of two major  $\pi N$  and  $\pi^+\pi^-p$  electroproduction channels with different non-resonant contributions allow us to evaluate the systematic uncertainties of these quantities in a nearly model-independent way

# Toward Exploration of EHM from Orbital Nucleon Excitations

**Continuum QCD Breakthrough:**  
N(1535)1/2<sup>-</sup> electrocouplings  
computed under a traceable  
connection to the QCD  
Lagrangian (green area).  
C.D Roberts et al, private  
communication

The first preliminary continuum  
QCD evaluation of electro-  
excitation amplitudes of the  
[70,1] supermultiplet  
resonances ( $L_{3q}=1$ ) with the  
same dressed quark mass mass  
function as used for the  
resonances with  $L_{3q}=0$

Studies of electroexcitation amplitudes for the resonances in the second region suggest the universality of the dressed quark mass function for the ground and different excited states of the nucleon, including the first spin-isospin flip, the first radial, and the first orbital ( $L_{3q}=1$ ) excitations.

Collecting the remainder of the approved RG-A beam time will give a factor of two more statistics

This will extend the Q<sup>2</sup> range of the  $\gamma_p N^*$  electrocouplings to **8-10 GeV<sup>2</sup>** for each of these channels – *the data collected so far will limit us to 6-8 GeV<sup>2</sup>*
