# Hall D BCAL Calculations - 2m Module <br> Z. Papandreou <br> May 27, 2004 

Assumptions:

- BCAL length (L): 443.87 cm
- inner BCAL radius ( $\mathrm{r}_{\mathrm{in}}$ ): 0.65 m
- outer BCAL radius ( $\mathrm{r}_{\text {out }}$ ): 0.90 m
- Volume ratio: $\mathrm{SciFi}: \mathrm{Pb}:$ Glue $=48: 42: 10$

Constants:

- $\rho_{\mathrm{Pb}}=11.35 \mathrm{~g} / \mathrm{cm}^{3}$
- $\rho_{\mathrm{Scifi}}=1.05 \mathrm{~g} / \mathrm{cm}^{3}$

Volumes:

- BCAL volume: $\pi\left[\mathrm{r}_{\text {out }}{ }^{2}-\mathrm{r}_{\text {in }}{ }^{2}\right] \mathrm{L}=5403527.6 \mathrm{~cm}^{3}$
- $\mathrm{V}_{\mathrm{Pb}}=2269481.6 \mathrm{~cm}^{3}$
- $\mathrm{V}_{\text {sciFi+glue }}=3134046.0 \mathrm{~cm}^{3}$
- $\mathrm{m}_{\mathrm{Pb}}=25758.6 \mathrm{~kg}$
- $\mathrm{m}_{\text {SciFi }}=3290.8 \mathrm{~kg}$
- mass $_{\text {tot }}=29049.4 \mathrm{~kg}$

That's almost 30 metric tons!

## 2m-Module Construction Considerations

- Construct Module-0 with dimensions 195 cm (l) $\mathbf{x} 13 \mathrm{~cm}$ (w) $\mathbf{x} \mathbf{2 5 c m}$ (t).
- Using the standard horizontal and vertical fiber pitch values $(0.135 \mathrm{~cm}$ and 0.118 cm$)$, we will require 212 layers (i.e. 212 sheets of lead) and with 96 fibers/layer we will need 20352 fibers.
- The procurred fibers from PHT are 410cm long. Each should be cut in 2 equal length ( 205 cm long) pieces.
- Then, they need to be glued into lead sheets so that $\approx 2.5 \mathrm{~cm}$ protrude from each side. This means that the lead, after swaging, must be around 200 cm long, and the preswaged sheets thus have to be 194 cm long ( $3 \%$ elongation after swaging).
- The galvanized steel mask needs to be 194 cm (length) x 13 cm (width). This will allow the final machining to yield a module that is 195 cm long.
