

Deuteron and Helium Form Factor Measurements at Large Q^2

Makis Petratos
Kent State U.

JLab 12 GeV Workshop
January 2000

- Review of recent d measurements
- F_d at larger Q^2
- $F_{^3\text{He}}$ at larger Q^2
- Experimental requirements

Meson Exchange Currents (MEC)

Impulse Approximation

DEUTERON FORM FACTORS

- Probe of deuteron structure
 - Conventional framework:
 - Impulse Approximation (IA)
 - Non-relativistic
 - Relativistic
 - Meson exchange currents (MEC)
 - Isobar configurations (IC)
 - Six-quark admixtures (6q)
- $$F = F_{IA} + F_{MEC} + F_{IC} + F_{6q}$$

- Quark-gluon approaches:
 - Dimensional scaling
 - Perturbative QCD

=

- Dimensional Scaling Quark Model

$$\sqrt{A} \sim (Q^2)^{-(n-1)}$$

$n = 6$ quarks

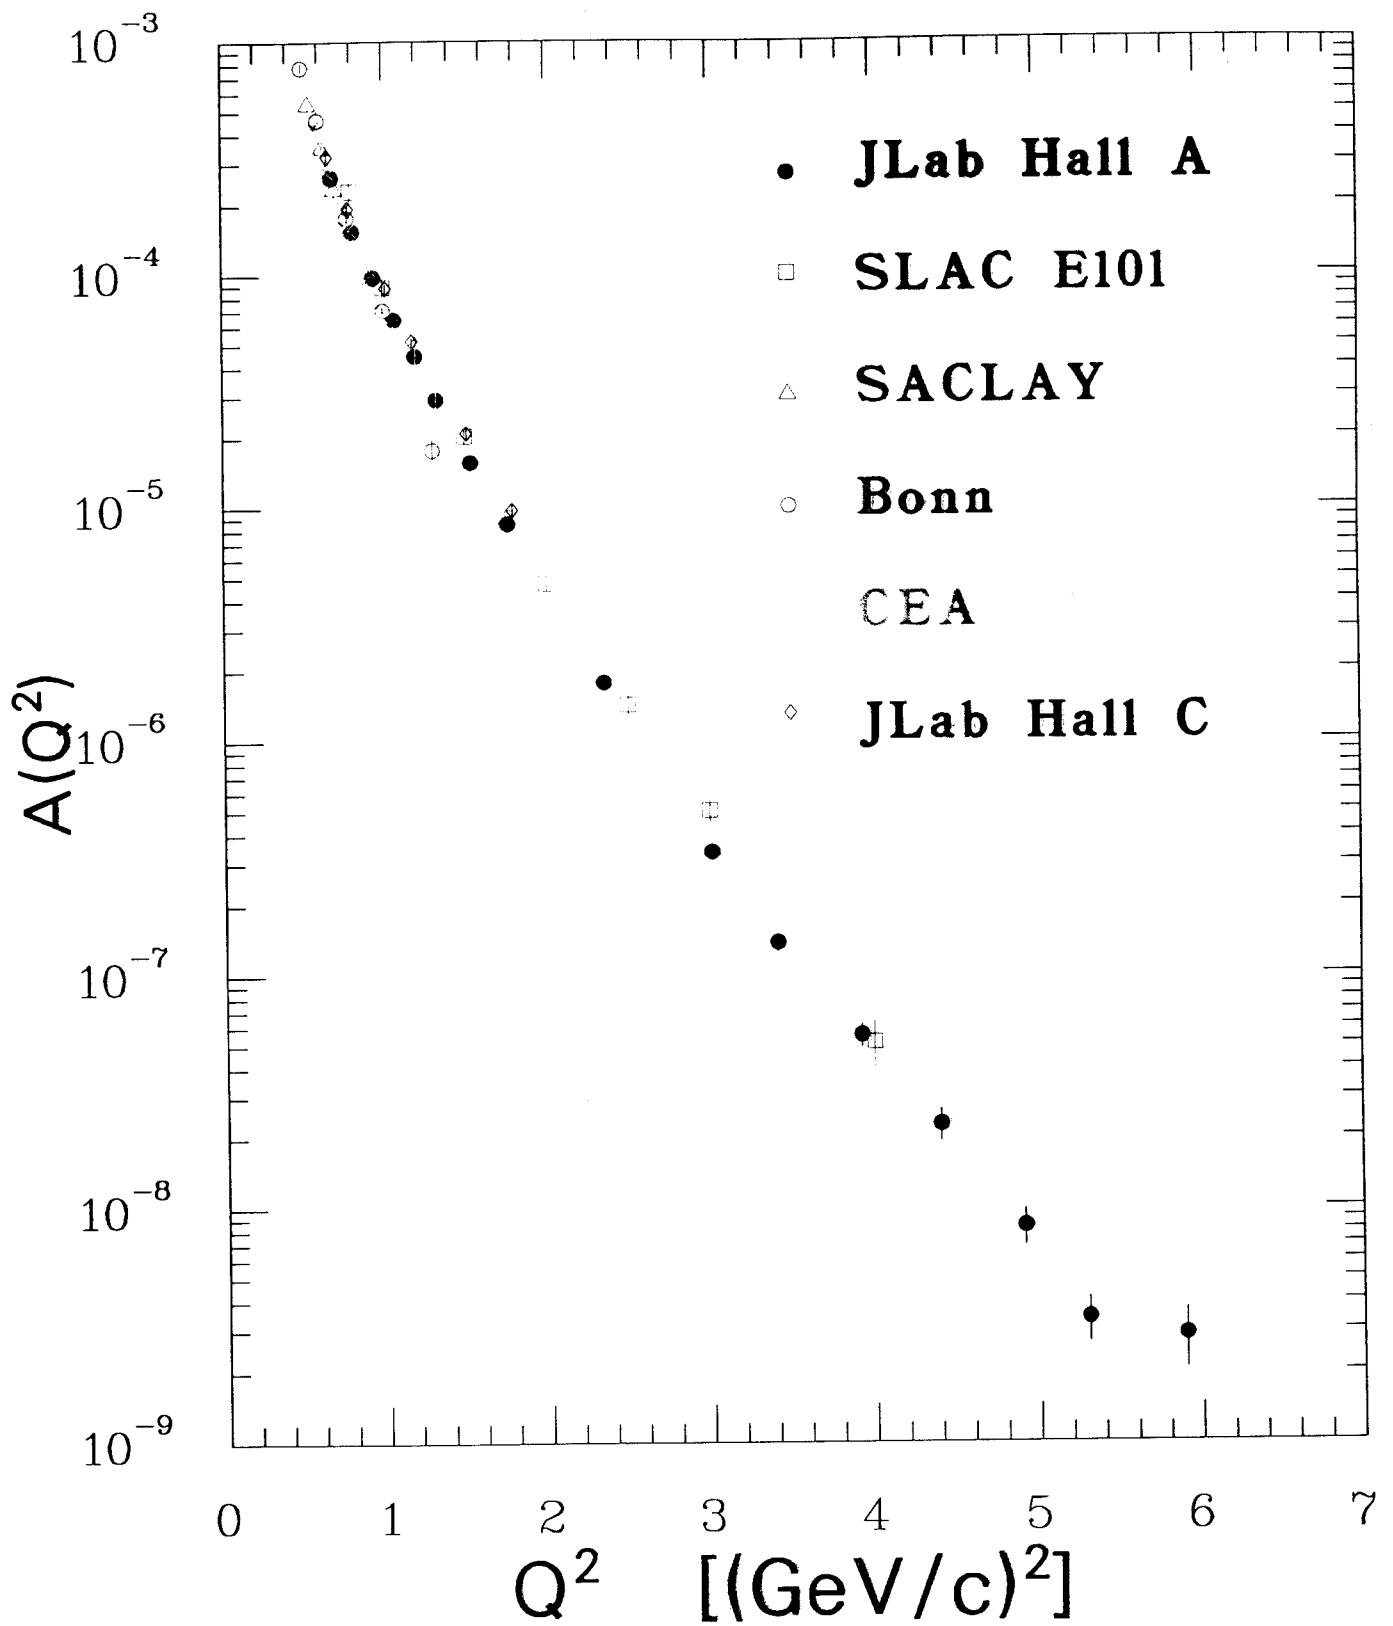

$$\sqrt{B} \sim (Q^2)^{-n}$$

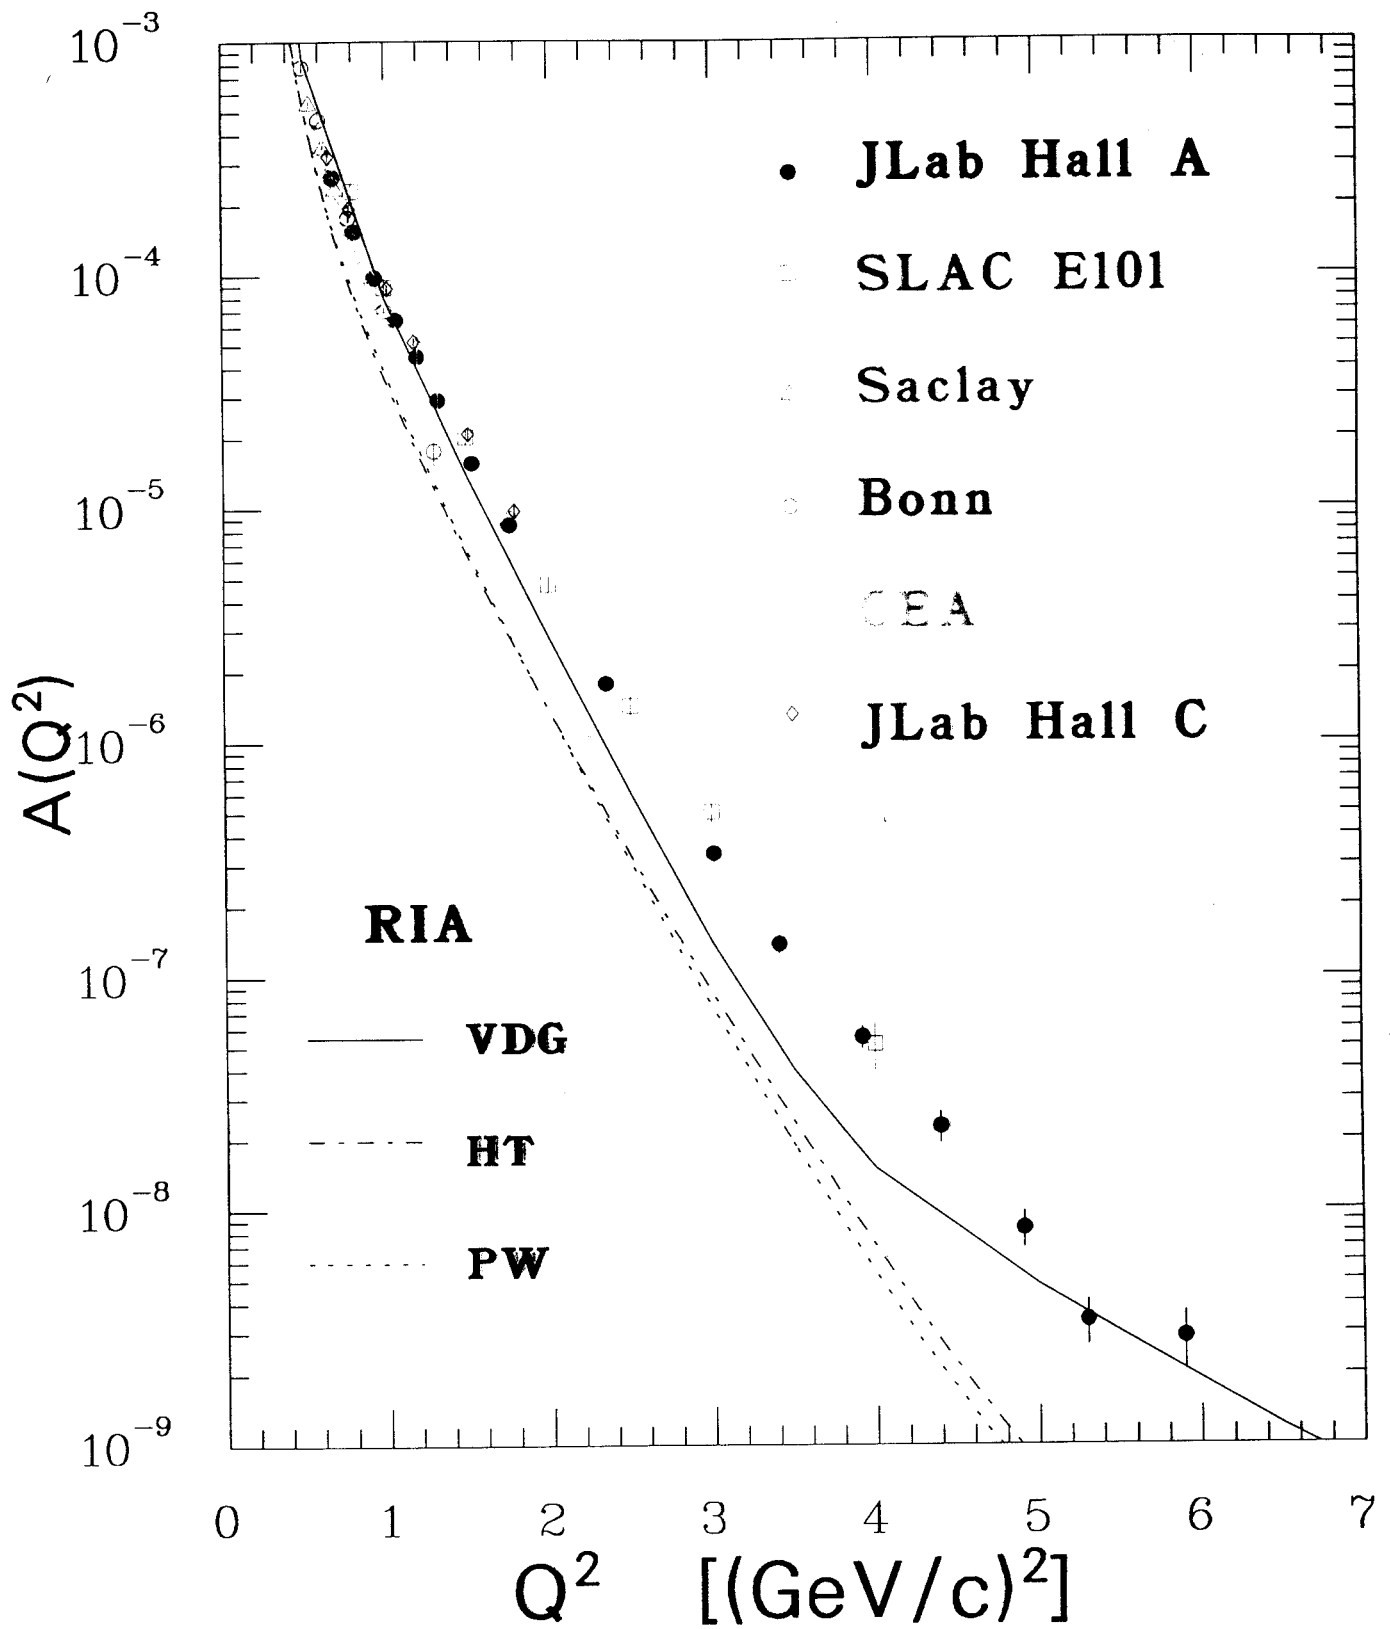

- Perturbative QCD

$$\sqrt{A} = \int_0^1 \int_0^1 dx dy \phi_d^+(y, Q) T(x, y, Q) \phi_d(x, Q)$$

$$\sqrt{A} = \left[\frac{\alpha_s(Q^2)}{Q^2} \right]^5 \sum_{m,n} d_{mn} \left(\ln \frac{Q^2}{\Lambda^2} \right)^{-\gamma_n - \gamma_m}$$

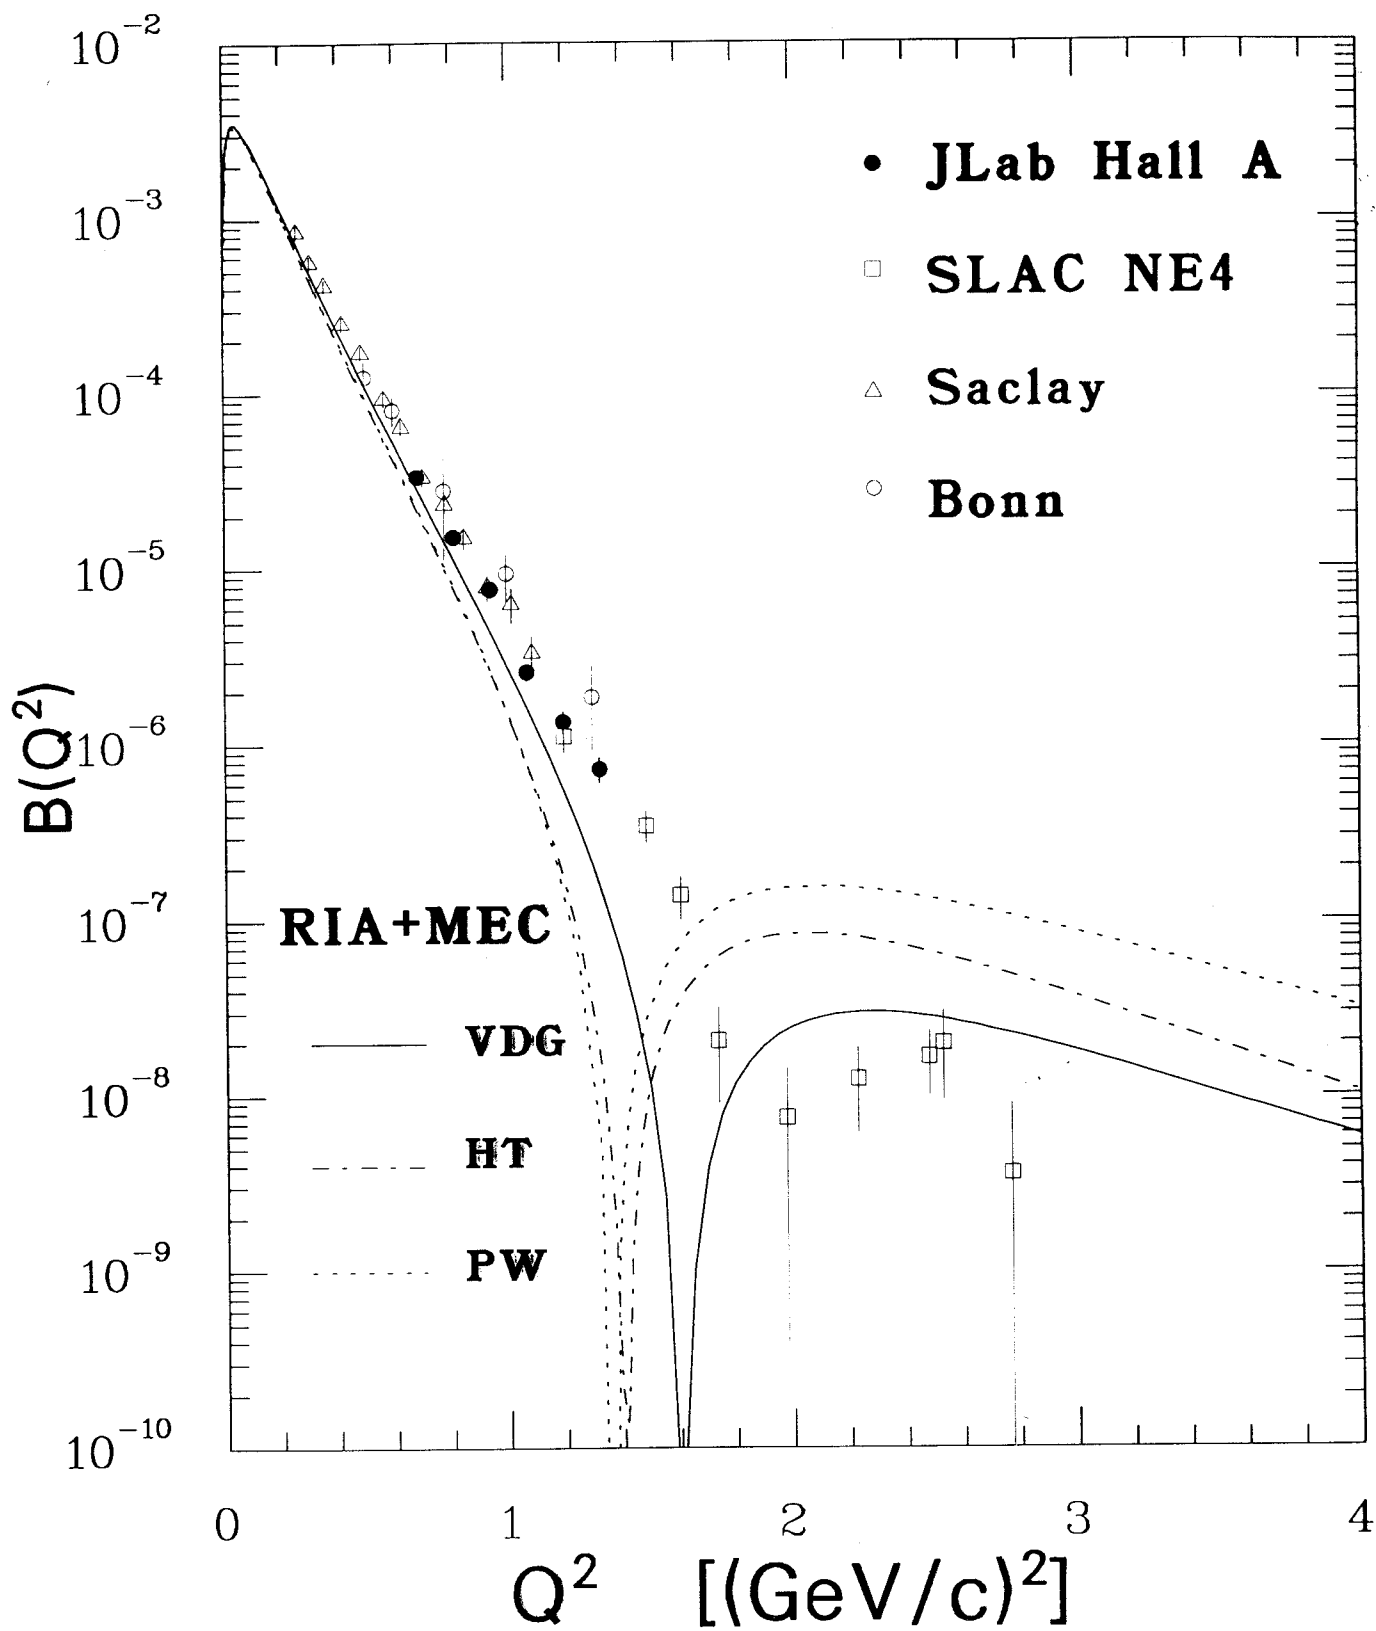

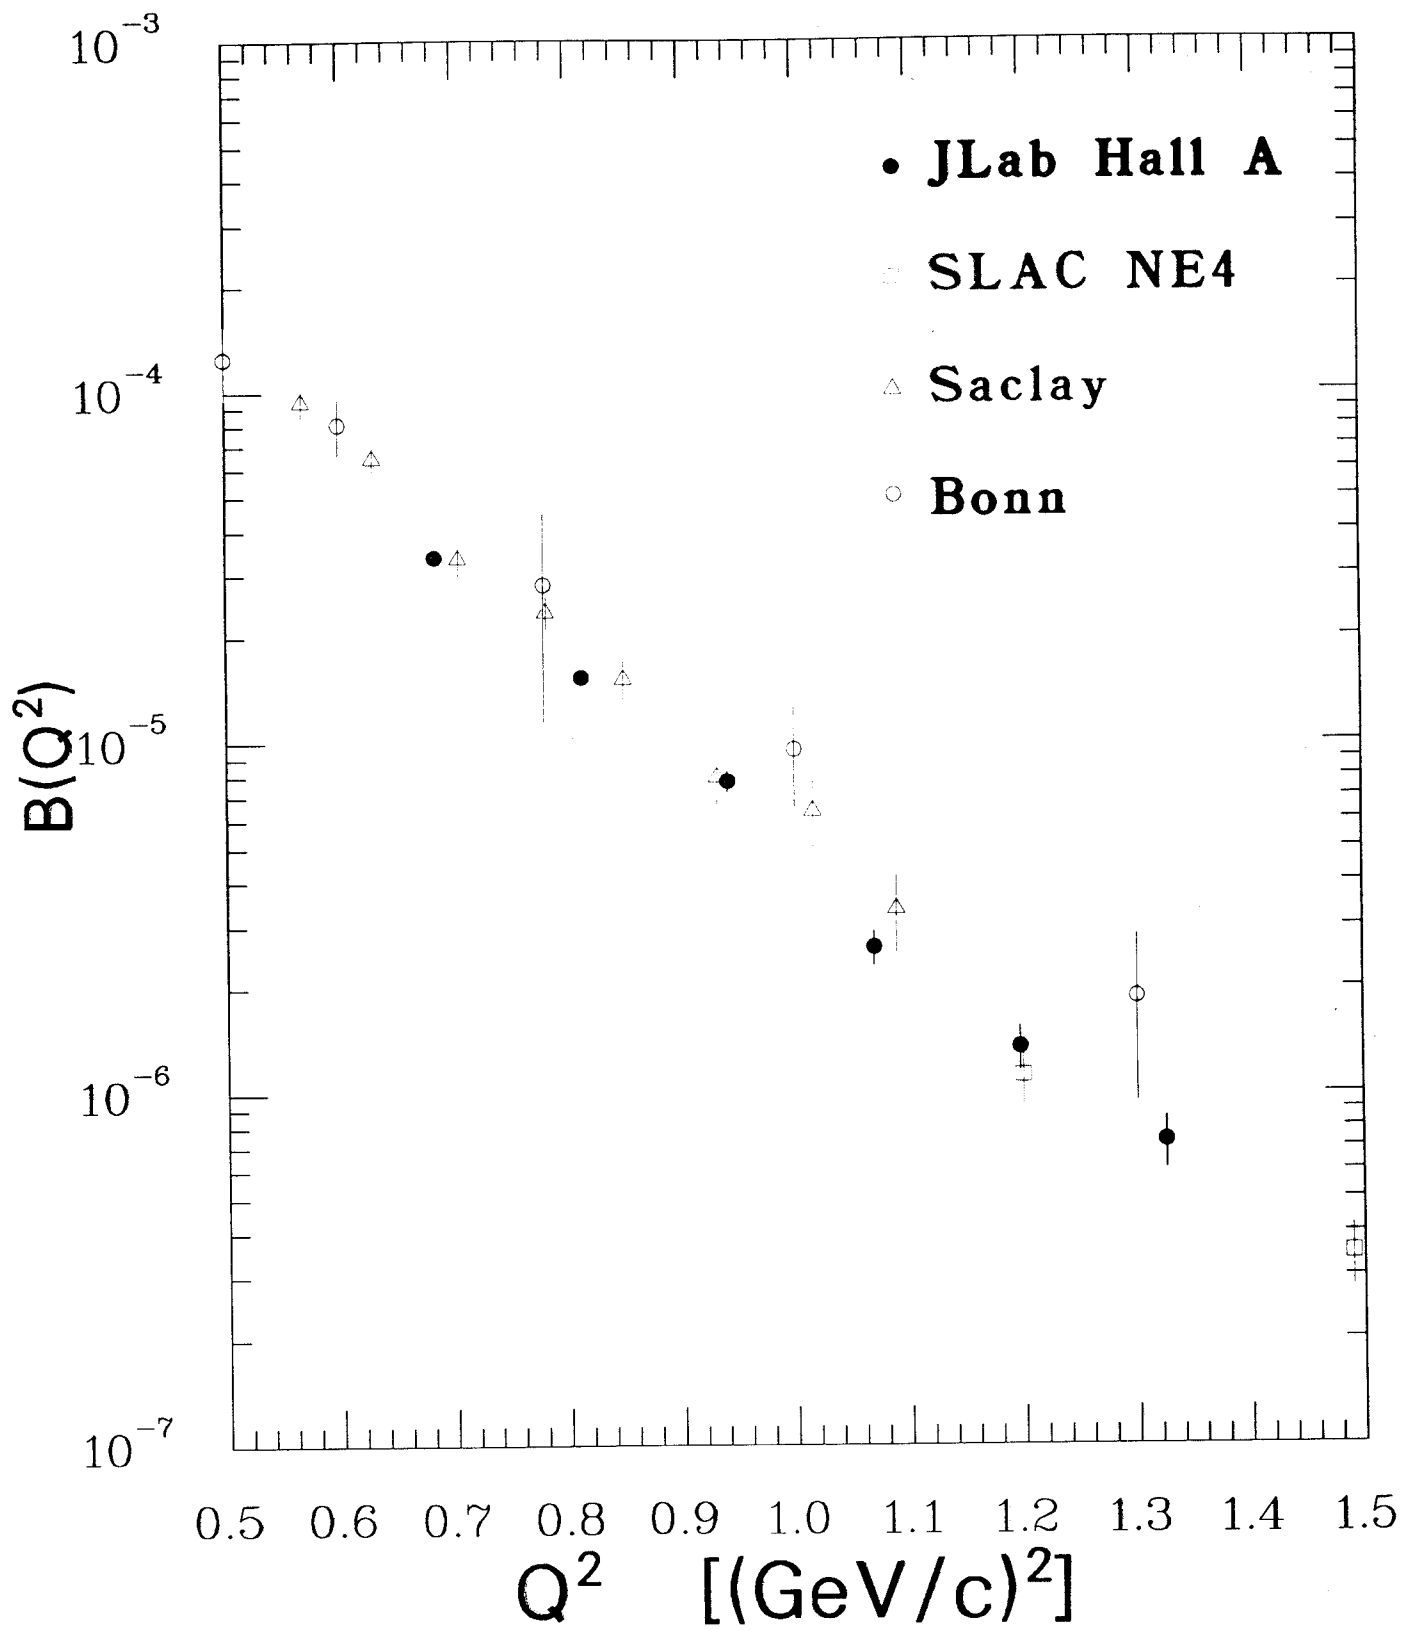

Quark Dimensional Scaling

$$F_d \equiv \sqrt{A}$$

Perturbative QCD

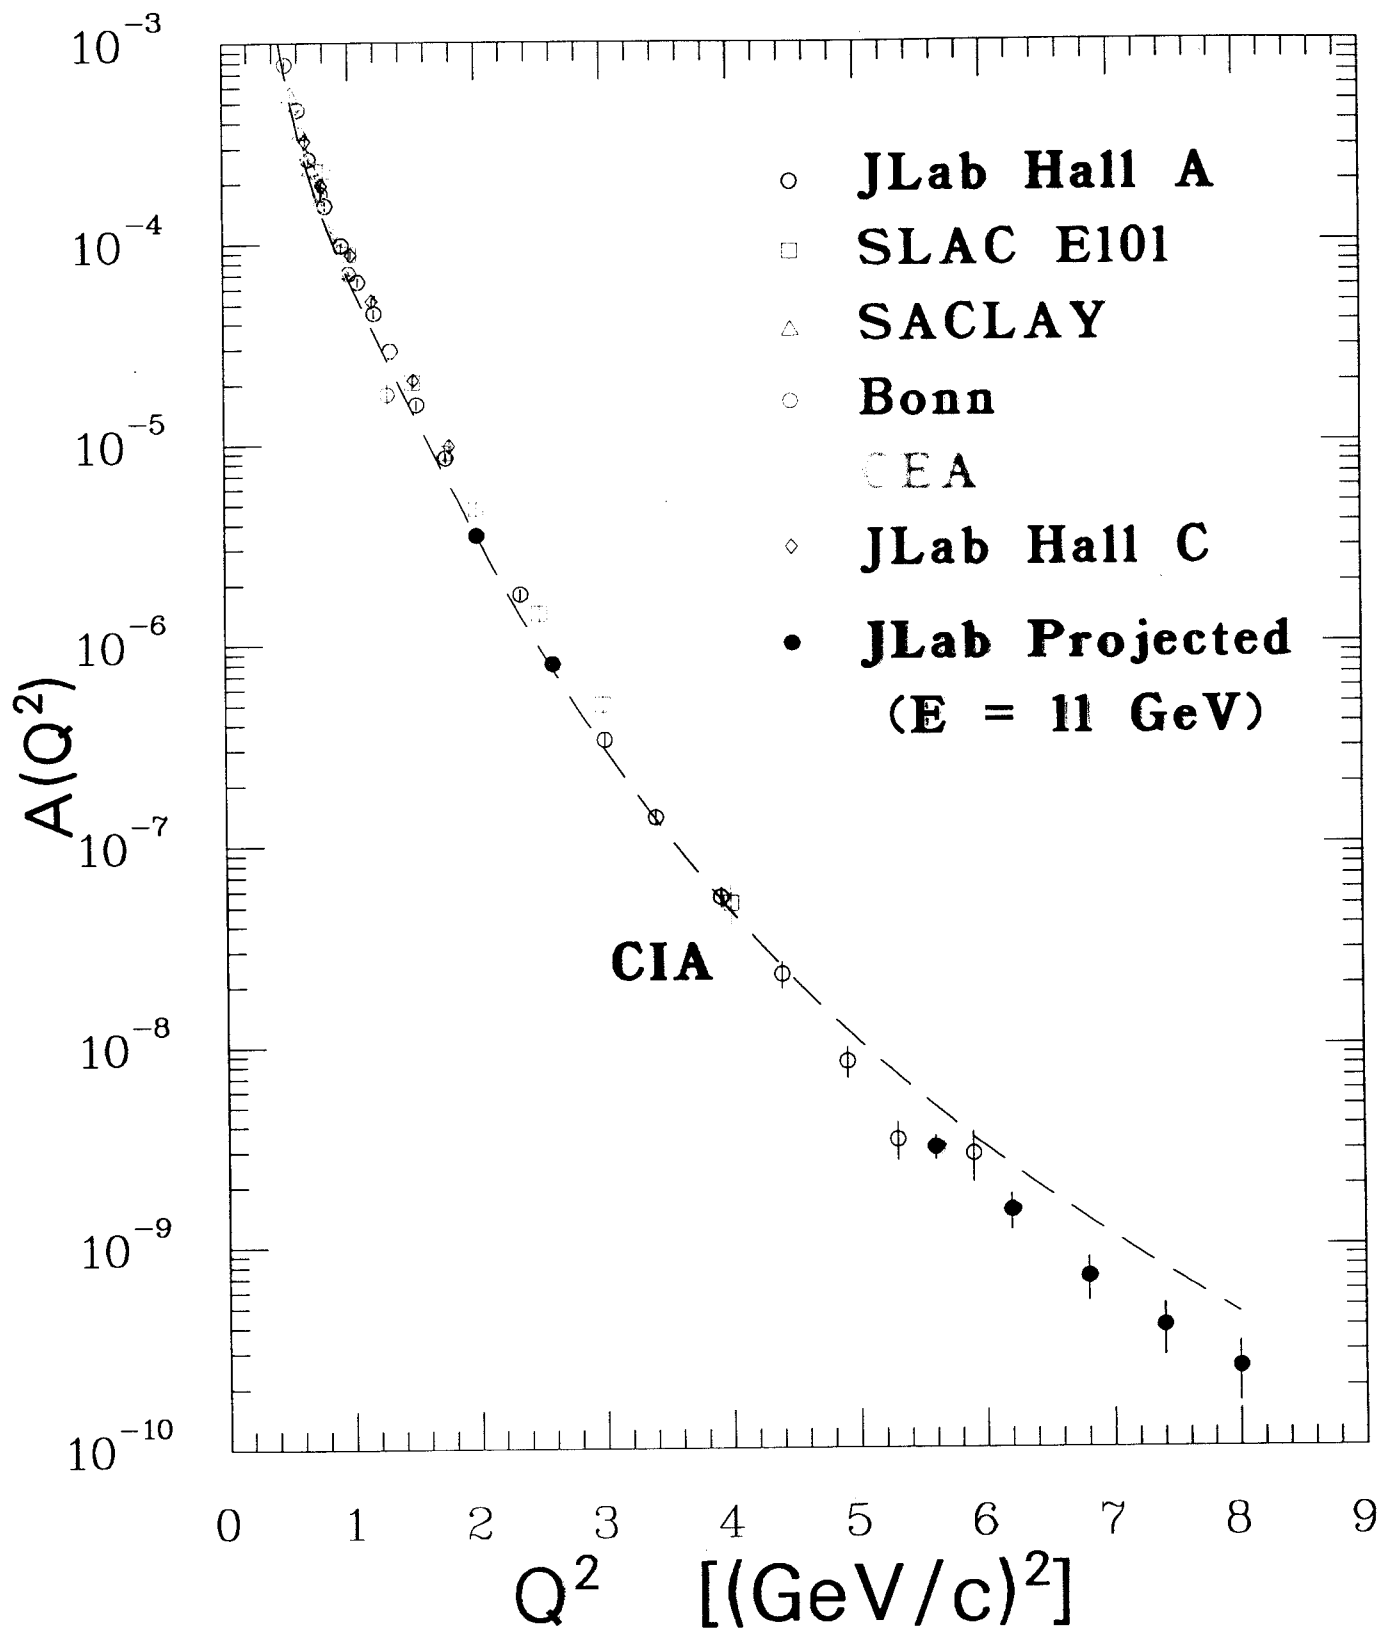

Deuteron Magnetic Form Factor Setup

d, ^3He A(Q²)

- e d, e ^3He coincidence exps
- Beam current 50 μA
- d target 25 cm
- ^3He target 20 cm
5 K / 15 atm
0.1 g/cm³
- Electrons SHMS
- Recoils HMS
- Cross sections $\sim 10^{-41}$ cm²/sr

CONCLUSIONS

- $E = 11 \text{ GeV}$ ideal/sufficient for

$$F_d(Q^2)$$

$$Q^2 \approx 8 \text{ GeV}^2$$

$$F_{\text{He}}^3(Q^2)$$

$$Q^2 \approx 140 \text{ fm}^{-2}$$

- Must have 2 high P spectrometers
large ΔQ
- Invest in longer targets to compensate for reduced current
- Continue testing Few-Body "Standard Model" and quark dimensional scaling predictions
