

Contents

1	Motivation	7
2	Neutral Pion Photoproduction via the Primakoff Effect	7
3	Theoretical Developments	7
4	Preliminary Results on the π^0 Lifetime	7
4.1	Cross Section Extraction	7
4.2	Determination of $\Gamma_{\pi^0 \rightarrow \gamma\gamma}$	7
4.3	Theoretical Calculations on Nuclear Form Factors and Backgrounds	7
4.4	High precision measurement of the absolute cross section for electron Compton scattering	7
5	Instrumentation and Experimental Techniques – Current Status and Planned Upgrades	7
5.1	Targets	7
5.2	The neutral pion detector	7
5.2.1	Charged particle veto detector	7
5.2.2	The hybrid calorimeter <i>HYCAL</i> (including LMS)	7
5.3	Luminosity monitoring	20
5.3.1	Absolute tagging ratios	22
6	Effects of incident electron beam intensity on absolute tagging ratios	23
7	Effects of collimator size	23
8	Effects of collimator position misalignment	25
9	Effects of HyCal scraping due to beam mis-steering (uncollimated beam)	26
10	Long and short term reproducibility with uncollimated beam	29
11	Effects of the PS dipole field with collimated beam	31
12	Absorption in the target	32
12.0.2	Relative tagging ratios measured with pair production	33
13	Effect of Incident Electron Beam Intensity on Relative Tagging Ratios	35
14	Run-to-Run Stability of Relative Tagging Ratios	35
15	Inefficiency of the Tagger	37
16	Correction of Photon Flux for Affected Runs	39
16.1	A high precision measurement of the absolute cross section for pair production	39

17	Cross-Section	46
18	Error Evaluation and Summary	49
18.1	Absolute cross section for electron Compton scattering	53
18.2	Photon beam position monitor	53
18.3	Data Acquisition and electronics	53
19	Plans for a future run	53
19.1	New improvements	53
19.2	Run time and schedule	53
20	Summary	53
21	Appendix I: Previous Experiments	53
21.0.1	The direct method	53
21.0.2	Measurements using $\gamma\gamma$ collisions	55
21.0.3	Measurements using the Primakoff effect	55
