## JLab E-01-006 Resonances Spin Structure (RSS)

Precision Measurement of the Nucleon Spin Structure Functions in the Region of the Nucleon Resonances
U. Basel, Florida International U., Hampton U., U. Massachusetts, U. Maryland, Mississippi S. U., North Carolina A\&T U., U. of N. C. at Wilmington, Norfolk S. U., Old Dominion U., S.U. New Orleans, U. of Tel-Aviv, TJNAF, U. of Virginia, Virginia P. I. \& S.U., Yerevan Physics I.

Spokesmen: Oscar A. Rondon (UVA) and Mark K. Jones (JLab)

## Physics:

- Measure proton and deuteron spin asymmetries $\mathbf{A}_{1}\left(W, Q^{2}\right)$ and $\mathbf{A}_{2}\left(W, Q^{2}\right)$ at momentum transfer $Q^{2} \approx 1.3 \mathrm{GeV}^{2}$ and invariant mass $0.8 \leq W \leq 2 \mathrm{GeV}$.
- Study $W$ dependence, onset of polarized local duality, twist-3 effects.
- Extract asymmetries from inclusive polarized electron scattering on polarized nuclei.

## RSS technique

- Measure count asymmetries $\mathrm{A}_{\|}, \mathrm{A}_{\perp}$ on protons, deuterons
- Equipment: Hall C
- CEBAF polarized electron beam
- 2 cm diameter raster at target
- Polarized ammonia target
- Luminosity $\sim 10^{35} \mathrm{~Hz} \mathrm{~cm}^{-2}$
- High Momentum Spectrometer HMS
$-\theta_{\text {HмS }}=-13.2^{\circ}$
- Took data $1 / 21$ to $3 / 3 / 2002$
- 160 M proton triggers
- 350 M deuteron triggers

## RSS kinematics

- Beam energy 5.755 GeV
- HMS angle $13.2^{\circ}$
- HMS central momenta:
- $4.7 \mathrm{GeV} / \mathrm{c}$
- $4.1 \mathrm{GeV} / \mathrm{c}$
- Final state mass range:
- $0.8 \mathrm{GeV} \leq W \leq 2.0 \mathrm{GeV}$
- $\left\langle Q^{2}\right\rangle=1.3[\mathrm{GeV} / \mathrm{c}]^{2}$

## Polarized Target

- Dynamic Nuclear Polarized ammonia $\left(\mathrm{NH}_{3}\right)$ and deuterated ammonia $\left(\mathrm{ND}_{3}\right)$ targets
- Carbon disks, He for normalization
- Top and bottom target cells

## Measured asymmetries $\mathrm{A}_{\|}, \mathrm{A}_{\perp}$

$$
\begin{gathered}
A_{\|, \perp}=\frac{1}{C_{N} f_{R C}}\left(\frac{\epsilon}{f P_{b} P_{t}}-C_{D}\right)+A_{R C} \\
\epsilon=\frac{L-R}{L+R}
\end{gathered}
$$

- $L, R=$ charge normalized, dead time and pion corrected numbers of counts for opposite beam helicities
- $P_{b^{\prime}} P_{t}=$ beam, target polarizations
- $f=$ dilution factor
- $C_{N}, C_{D}=$ corrections for N in ammonia ( $C_{D}$ for deuterium only).
- $f_{R C} A_{R C}=$ radiative corrections

## How to get $\mathrm{A}_{1}, \mathrm{~A}_{2}, g_{1}$, and $g_{2}$

- Full expression for $R S S$ analysis

$$
\begin{array}{r}
A_{1}=\frac{Q^{2}}{D^{\prime}} \frac{\left(\nu \cot (\theta / 2)+E^{\prime} \sin \theta\right) \cos \phi A_{\|}+E^{\prime}(1+\cos \theta) A_{\perp}}{E^{\prime} \sin \theta \cos \phi\left(Q^{2}+2 E\left(E+E^{\prime} \cos \theta\right)\right)} \\
A_{2}=\frac{\sqrt{Q^{2}}}{D^{\prime}} \frac{\left(Q^{2} \cot (\theta / 2)-\nu E^{\prime} \sin \theta\right) \cos \phi A_{\|}+\left(Q^{2}+\nu\left(E+E^{\prime} \cos \theta\right)\right) A_{\perp}}{E^{\prime} \sin \theta \cos \phi\left(Q^{2}+2 E\left(E+E^{\prime} \cos \theta\right)\right)}
\end{array}
$$

- $\boldsymbol{D}^{\prime}\left(E, E^{\prime}, \theta, R\right)=$ depolarization factor
- Have both SA's and SF's calculated using above.

$$
\begin{aligned}
g_{1} & =\frac{F_{1}}{1+\gamma^{2}}\left(A_{1}+\gamma A_{2}\right) \\
g_{2} & =\frac{F_{1}}{1+\gamma^{2}}\left(A_{2} / \gamma-A_{1}\right) \quad \gamma=\sqrt{\frac{Q^{2}}{\nu^{2}}}
\end{aligned}
$$

## Status as of Jan. 2005

- Hallc Engine and MC upgraded (M. Jones and O. Rondon)
- Performed 2nd pass analysis (F. Wesselmann)
- Packing fractions and dilution factors for proton and deuteron (Tajima)
- Proton elastic asymmetry (M. Jones)
- Radiative Corrections (K. Slifer)

## Status of Software (2nd pass)

- HallC Engine
- Added Phi dependence to target field to remove the correlation between $x$ ' and $W$ for perp data
- optics matrix elements have dependence on vertical positions
- Run database has been updated
- 2nd pass replays have been performed
- Monte Carlo (pol_hms_single)
- Added Phi dependence to target field for perp data $(\rightarrow$ caused shift in HMS W for perp runs)
- HMS momentum for the perp runs were adjusted to get the correct $W$ peaks
- Programming errors were found and fixed
- QFS and deuteron models improved
- Used to obtain packing fractions and dilution factors

## Target Quantity Reconstruction

NH3, // Field, $4078 \mathrm{MeV} / \mathrm{c}$

NH3, $\perp$ Field, 4078 MeV/c

- Data
- MC

## Normalization Examples

- Comparison of Carbon data with MC (// Field)
$4703 \mathrm{MeV} / \mathrm{c}$

10
$4078 \mathrm{MeV} / \mathrm{c}$

## 

## Normalization Examples

- Comparison of Carbon data with MC ( $\perp$ Field)
$4703 \mathrm{MeV} / \mathrm{c}$

II
$4078 \mathrm{MeV} / \mathrm{c}$

## Individual cell Packing Fractions (Preliminary)

- Scale factor determined by the ratio of Carbon data to MC
- NH3,Top target (Hi: 4703 MeV ; Lo: 4078 MeV )
- Need to determine 8 packing fractions

## Preliminary Dilution Factors (examples)

NH3 and TOP Target

- Dilution factors (DFs) obtained for each target configuration
- The MC was run with the preliminary packing fractions, and the DFs are determined by the ratio of proton counts to the total counts (for NH 3 target)

## $\mathrm{A}_{1}{ }^{\mathrm{p}}, \mathrm{A}_{2}{ }^{\mathrm{p}}, \mathrm{A}_{1}{ }^{\mathrm{d}}$ and $\mathrm{A}_{2}{ }^{\mathrm{d}}$ (Preliminary)

- 2nd pass results
- But the dilution factors from the Ist-pass analysis were used
- No corrections applied yet

## $\mathrm{g}_{1} \mathrm{p}$ and $\mathrm{g}_{2}{ }^{\mathrm{p}}$ (Preliminary)

- The dilution factors from the Ist-pass analysis were used
- No corrections applied yet

## $g_{1}{ }^{\mathrm{d}}$ and $\mathrm{g}_{2}{ }^{\mathrm{d}}$ (Very Preliminary)

- The dilution factors from the Ist-pass analysis were used
- No corrections applied yet

## ep elastic asymmetry (Preliminary)

- Parallel Asymmetry (average value is $0.176 \pm 0.0024$ ) The top and bottom asymmetries agree fairly well.
- Perpendicular Asymmetry (average value is $-0.089 \pm 0.0028$ ) The top and bottom asymmetries agree at about 2 sigmas.

## ep elastic asymmetry (Preliminary)

- Dependence on scattering angle (change in kinematics)
- Ratio of perp to para asymmetry agrees with the ratio of $\mathrm{Ge} / \mathrm{Gm}$ from the polarization transfer.

## ep elastic asymmetry (Preliminary)

- Dependence on scattering angle (change in kinematics)
- Ratio of perp to para asymmetry agrees with the ratio of $\mathrm{Ge} / \mathrm{Gm}$ from the polarization transfer.
- If data points are multiplied by a common factor, data agree with the predicted asymmetry assuming $\mathrm{Ge} / \mathrm{Gm}$ from polarization transfer

## Other things to do

- Next pass analysis (pass2a) (F.Wesselmann)
- Systematic uncertainties
- Neutron quasielastic asymmetry (Tajima)
- Corrections
i. Radiative corrections (K. Slifer)
ii. Nitrogen asymmetry
