The PMT Detector was re-fiducialized on May 23rd. The Z axis was defined by constructing a line through the upstream and downstream centers of the box. The upstream slot of the box was used to control roll (Y axis). The origin was created by intersecting the Z axis and the plane constructed through the eight downstream aluminum tube faces. This was done in order to keep continuity between previous surveys. The table below shows the as-set locations of each of the paddle corner points as well as the upstream and downstream box centers.

The coordinates in the table below are reported in a beam following system (along the pitched line) relative to the MOLDET ideal. See picture below for naming convention.
