data : inspection\hallbltorus $12 \mathrm{~g} \backslash 150826 \mathrm{~A}$
The data below is from the Torus magnet survey of August $25^{\text {th }}$ and $26^{\text {th }}, 2015$. The twelve found edge fiducial points were used to form a plane and a circle for the upstream and downstream positions. The origin is the coil case design zero as shown on drawing B00000-04-01-1101. The $Z$ axis is determined by the central hub flanges, with the positive $Z$ going from upstream to downstream. Positive $X$ is perpendicular to the beam left from this line and positive Y is perpendicular in the vertical direction (not vertical to gravitiy).

In the local system, the found and ideal coordinates, plus their deltas are shown below. Additionally, a plane and circle were formed to the found data. Units are millimeters.

The deltas above are relative to the coordinate system with a $+z$ being too far downstream, $+x$ being to the beam left from ideal, and $+y$ above the ideal point. The planar errors are deltas from the determined plane. The planes normal angle is downstream and a positive value is the amount downstream. The radial error is the amount from the calculated circle center. A positive radial error means the point lies beyond the circle's edge.

The calculated circle centers are shown below, in the above referenced system.

| Circle Centers |  |  |  |
| :--- | :---: | :---: | :---: |
| Position | X | Y | Z |
| Upstream | -0.42 | -1.35 | -499.11 |
| Downstream | -0.20 | -0.68 | 885.73 |

The pitch and yaw rotation angles for the planes are shown below. Pitch is the rotation about the X axis. Yaw is the rotation about the Y axis. Positive follows the right hand rule. Units are degrees.

| rotation angles for upstream |  |
| :--- | :--- |
| Pitch | $89.9790^{\circ}$ |
| Yaw | $90.0093^{\circ}$ |
|  |  |
| Rotation Angles for Downstream |  |
| Rx from Y | $90.0202^{\circ}$ |
| Ry from Z | $90.0089^{\circ}$ |
