### DETAILS:

Below are the results from the Feb 22<sup>nd</sup> survey in Hall A which measured the foil targets layed out during the target mirror survey, as well as the locations of the superharps and BCM. The values represent the difference in millimeters from the ideal position of each fiducial. A positive X value is to the beam left, a positive Y is too high.

#### Target Mirror Autocollimation Line:

Horizontal angle to main beamline : 120.063 deg

Vertical angle : -0.42 deg (sloping down from target)
