Below are the results from the Hall A moller magnetic field probe survey. A +X is to the beam left, a +Z is downstream, and a +Y is up. Values are in millimeters. The upstream and downstream discs which supported the probe were each measured at four locations rotated 90 degrees apart as labeled on the discs. Two sets of coordinates are shown. The first set is relative to the field probe, which is where the magnet will be placed in the beam line. The second is relative to the magnet center to show the movements made on the probe when placed on the magnetic center. Both sets of data are centered on the magnet flanges along beam (in the Z direction).
