Below are the results from the survey carried out on the Line C moller polarimeter collimator. The coordinate system is established using the upstream flange and the center of the 80 millimeter long collimator #5 for the Z axis. The inside edge of collimators #6, and #7 controlled the rotation about the Z axis. A +Z is downstream, a +X is to the beam left, and a +Y is up. All measurements to collimators #6 and #7 are to the downstream face.
