## 7th August 2012

The 7th International Workshop on Chiral Dynamics Jefferson Lab, Newport News, VA

## Outline

(1) Motivation

(2) Dispersion Relation for $K_{\ell 4}$ Decays
(3) Results

## (4) Outlook

## Overview

(1) Motivation<br>Why $K_{\ell 4}$ ?<br>Why Dispersion Relations?

(2) Dispersion Relation for $K_{\ell 4}$ Decays
(3) Results
(4) Outlook

## Why $K_{\ell 4}$ ?

## Importance of $K_{\ell 4}$ decays

Unique information about some low energy constants of ChPT:

- $L_{1}^{r}, L_{2}^{r}, L_{3}^{r}$ multiply operators with four derivatives $\Rightarrow$ We need a four-"particle" process
- $K_{\ell 4}$ like a $2 \rightarrow 2$ scattering
- Happens at low energy, where ChPT is expected to converge better

## Why $K_{\ell 4}$ ?

## Importance of $K_{\ell 4}$ decays

- Provides information on $\pi \pi$ scattering lengths $a_{0}^{0}, a_{0}^{2}$
- Very precisely measured $\Rightarrow$ Test of ChPT
$\rightarrow$ Geneva-Saclay, E865, NA48/2
- Kaon physics: High precision at low energy as a key to new physics?
$\rightarrow$ NA62

## Why Dispersion Relations?

## Advantages of dispersion relations

- Summation of rescattering
- Connects different energy regions
- Based on analyticity and unitarity $\Rightarrow$ Model independence
- $\mathcal{O}\left(p^{6}\right)$ result available, but only useful if LECs are known

## Overview

## (1) Motivation

(2) Dispersion Relation for $K_{\ell 4}$ Decays

Kinematics and Matrix Element
Decomposing the Amplitude Integral Equations
(3) Results
(4) Outlook

## Kinematics and Matrix Element

## $K_{\ell 4}$ decays

Decay of a kaon in two pions and a lepton pair:

$$
K^{+}(p) \rightarrow \pi^{+}\left(p_{1}\right) \pi^{-}\left(p_{2}\right) \ell^{+}\left(p_{\ell}\right) \nu_{\ell}\left(p_{\nu}\right)
$$

$\ell \in\{e, \mu\}$ is either an electron or a muon.

## Kinematics and Matrix Element

## SM tree-level

## Kinematics and Matrix Element

Hadronic part of $K_{\ell 4}$ as $2 \rightarrow 2$ scattering

## Kinematics and Matrix Element

## Form factors

- Lorentz structure allows four form factors in the hadronic matrix element.

$$
\begin{aligned}
\left\langle\pi^{+}\left(p_{1}\right) \pi^{-}\left(p_{2}\right)\right| V_{\mu}(0)\left|K^{+}(p)\right\rangle & =-\frac{H}{M_{K}^{3}} \epsilon_{\mu \nu \rho \sigma} L^{\nu} P^{\rho} Q^{\sigma} \\
\left\langle\pi^{+}\left(p_{1}\right) \pi^{-}\left(p_{2}\right)\right| A_{\mu}(0)\left|K^{+}(p)\right\rangle & =-i \frac{1}{M_{K}}\left(P_{\mu} F+Q_{\mu} G+L_{\mu} R\right)
\end{aligned}
$$

- In experiments, just $K_{e 4}$ decays are measured, yet.

There, mainly one specific linear combination $F_{1}(s, t, u)$ of the form factors $F$ and $G$ is accessible.

## Decomposing the Amplitude

## Analytic properties

- $F_{1}(s, t, u)$ has a right-hand branch cut in the complex $s$-plane, starting at the $\pi \pi$-threshold.
- Left-hand cut present due to crossing.
- Analogous situation in $t$ - and $u$-channel.

## Decomposing the Amplitude

## Decomposition into functions of a single

 variableDecomposition has been done first for the $\pi \pi$ scattering amplitude.
$\rightarrow$ Stern, Sazdjian, Fuchs (1993)

Define a function that has just the right-hand cut of the partial wave $f_{0}$ :

$$
M_{0}(s):=P(s)+\frac{s^{4}}{\pi} \int_{4 M_{\pi}^{2}}^{\Lambda^{2}} \frac{\operatorname{Im} f_{0}\left(s^{\prime}\right)}{\left(s^{\prime}-s-i \epsilon\right) s^{\prime 4}} d s^{\prime}
$$

## Decomposing the Amplitude

Decomposition into functions of a single
variable
Define similar functions that take care of the right-hand cuts of $f_{1}$ and the $S$ - and $P$-waves in the crossed channels.

All the discontinuities are split up into functions of a single variable. $\Rightarrow$ Major simplification!

## Decomposing the Amplitude

Decomposition into functions of a single variable

We neglect:

- Imaginary parts of $D$ - and higher waves,
- High energy tail of dispersion integral from $\Lambda^{2}$ to $\infty$.

Both effects are of $\mathcal{O}\left(p^{8}\right)$.

## Decomposing the Amplitude

## Decomposition into functions of a single

 variableRespecting isospin properties, we end up with the following decomposition:

$$
\begin{aligned}
F_{1}(s, t, u) & =M_{0}(s)+\frac{2}{3} N_{0}(t)+\frac{1}{3} R_{0}(t)+R_{0}(u) \\
& +(u-t) M_{1}(s)-\frac{2}{3}\left[t(u-s)-\Delta_{K \pi} \Delta_{\ell \pi}\right] N_{1}(t) \\
& +\mathcal{O}\left(p^{8}\right)
\end{aligned}
$$

## Integral Equations

## Dispersion relation

Solution of the Omnès problem:

$$
M_{0}(s)=\Omega_{0}^{0}(s)\left\{P(s)+\frac{s^{3}}{\pi} \int_{4 M_{\pi}^{2}}^{\Lambda^{2}} \frac{\hat{M}_{0}\left(s^{\prime}\right) \sin \delta_{0}^{0}\left(s^{\prime}\right)}{\left|\Omega_{0}^{0}\left(s^{\prime}\right)\right|\left(s^{\prime}-s-i \epsilon\right) s^{\prime^{3}}} d s^{\prime}\right\}
$$

with the Omnès function

$$
\Omega_{0}^{0}(s):=\exp \left\{\frac{s}{\pi} \int_{4 M_{\pi}^{2}}^{\infty} \frac{\delta_{0}^{0}\left(s^{\prime}\right)}{s^{\prime}\left(s^{\prime}-s-i \epsilon\right)} d s^{\prime}\right\} .
$$

Similar relations for the other functions.

## Integral Equations

## Phase inputs

We need the following phase shifts:

- $\delta_{0}^{0}, \delta_{1}^{1}: \pi \pi$ scattering
- $\delta_{0}^{1 / 2}, \delta_{1}^{1 / 2}, \delta_{0}^{3 / 2}: K \pi$ scattering
( $\delta_{l}^{I}: l$ - angular momentum, $I$ - isospin)

## Integral Equations

## Hat functions

- The left-hand cut is contained in $\hat{M}_{0}(s)$.
- $\hat{M}_{0}(s)$ is given as angular averages of $N_{0}, N_{1}, \ldots$

## Integral Equations

## Intermediate summary

- Problem parametrised by five subtraction constants.
- Elastic scattering phase shifts as inputs.
- Energy dependence fully determined by the dispersion relation.

## Integral Equations

## Intermediate summary

- Set of coupled integral equations:
$\Rightarrow M_{0}(s), M_{1}(s), \ldots$ : DR involving $\hat{M}_{0}(s), \hat{M}_{1}(s), \ldots$
$\Rightarrow \hat{M}_{0}(s), \hat{M}_{1}(s), \ldots$ : Angular integrals over $M_{0}(s), M_{1}(s), \ldots$
- System solved by iteration
- Problem linear in subtraction constants $\Rightarrow$ Fit data with a linear combination of five basic solutions

## Overview

## (1) Motivation

## (2) Dispersion Relation for $K_{\ell 4}$ Decays

(3) Results

Fit to Data
Matching to ChPT
Preliminary Values for LECs

## (4) Outlook

## Fit to Data

## Fit of the $S$-wave

## Fit to Data

## Fit of the $S$-wave

## Fit to Data

Fit of the $S$-wave

## Matching to ChPT

## Determination of LECs

- Matching the dispersive result to ChPT at $s=t-u=0$ : Below threshold, where ChPT converges better
- $L_{1}^{r}, L_{2}^{r}$ and $L_{3}^{r}$ can be determined

## Preliminary Values for LECs

## Determination of LECs - preliminary!

Results of the matching to $\mathcal{O}\left(p^{4}\right) \mathrm{ChPT}(\mu=770 \mathrm{MeV})$

$$
10^{3} L_{1}^{r} \quad 10^{3} L_{2}^{r} \quad 10^{3} L_{3}^{r}
$$

## Overview

## (1) Motivation

(2) Dispersion Relation for $K_{\ell 4}$ Decays
(3) Results
(4) Outlook

## Outlook

## Work in progress

- Isospin corrections
- Matching to $\mathcal{O}\left(p^{6}\right)$ ChPT

## Outlook

## Summary

- Parametrisation valid up to and including $\mathcal{O}\left(p^{6}\right)$
- Model independence
- Full summation of rescattering effects
- Very precise data available
- Advantage over pure ChPT: Matching below threshold, where ChPT converges better $\Rightarrow$ LECs
