

Towards the hadron spectrum
using spatially-extended operators
in lattice QCD

Colin Morningstar

Carnegie Mellon University

3rd Topical Workshop on Lattice Hadron Physics

Jefferson Lab

July 31, 2006

Lattice Hadron Physics Collaboration

- Lattice Hadron Physics Collaboration (LHPC) formed in 2000
- LHPC has several broad goals
 - compute QCD spectrum (baryons, mesons,...)
 - hadron structure (form factors, structure functions,...)
 - hadron-hadron interactions
- current members of **spectroscopy** effort:
 - Robert Edwards, George Fleming, Jimmy Juge, Adam Lichtl, CM, Nilmani Mathur, David Richards, Ikuro Sato, Steve Wallace

LHPC spectroscopy efforts

- extracting spectrum of resonances is big challenge!!
 - need sets of extended operators (correlator matrices)
 - multi-hadron operators needed too
 - deduce resonances from finite-box energies
 - anisotropic lattices ($a_t < a_s$)
 - inclusion of light-quark loops at realistically light quark mass
- long-term project
- efforts divide into two categories
 - operator technology
 - Monte Carlo updating technology (light quark loops)
- this talk is an interim status report
 - focus on baryons

Outline

- how to extract excited-state energies from Monte Carlo computations
 - need for multi-hadron operators
- operator construction
 - spatially-extended operators
 - symmetry channels
- field smearing
- operator pruning
- milestone reached: extraction of nine or more levels in a symmetry channel!!
- outlook and conclusion

Excited states, resonances in lattice Monte Carlo

Principal correlators

- extracting excited-state energies described in
 - C. Michael, NPB **259**, 58 (1985)
 - Luscher and Wolff, NPB **339**, 222 (1990)
- exploits the variational method
- for $N \times N$ correlator matrix $C_{\alpha\beta}(t) = \langle 0 | O_\alpha(t) O_\beta^\dagger(0) | 0 \rangle$ define N *principal correlators* $\lambda_\alpha(t, t_0)$ as eigenvalues of

$$C(t_0)^{-1/2} C(t) C(t_0)^{-1/2}$$

where t_0 (the time defining the "metric") is small

- can show $\lim_{t \rightarrow \infty} \lambda_\alpha(t, t_0) = e^{-(t-t_0)E_\alpha} (1 + e^{-t\Delta E_\alpha})$
- N *principal effective masses* $\Omega_\alpha(t) = \ln \left(\frac{\lambda_\alpha(t, t_0)}{\lambda_\alpha(t+1, t_0)} \right)$
now tend (plateau) to N lowest-lying stationary-state energies

Unstable particles (resonances)

- our computations done in a periodic box
 - momenta quantized
 - discrete energy spectrum of stationary states → single hadron, 2 hadron, ...
- scattering phase shifts → resonance masses, widths (in principle) deduced from finite-box spectrum
 - B. DeWitt, PR **103**, 1565 (1956) (sphere)
 - M. Luscher, NPB**364**, 237 (1991) (cube)
- first goal: get finite-box spectrum
 - must extract multi-hadron state energies
 - check volume dependences
 - know masses of decay products → placement and pattern of multi-particle states roughly known

Operator construction

Operator design issues

- must facilitate spin identification
 - shun the usual method of operator construction which relies on cumbersome continuum space-time constructions
 - focus on constructing operators which transform irreducibly under the symmetries of the lattice
- one eye on maximizing overlaps with states of interest
- other eye on minimizing number of quark-propagator sources
- use building blocks useful for baryons, mesons, multi-hadron operators
- must project onto definite spin polarizations or will observe many degeneracies

Three stage approach

- concentrate on baryons at rest (zero momentum)
- operators classified according to the irreps of O_h

$$G_{1g}, G_{1u}, G_{2g}, G_{2u}, H_g, H_u$$

- (1) basic building blocks: smeared, covariant-displaced quark fields $(\tilde{D}_j^{(p)}\tilde{\psi}(x))_{Aa\alpha}$ p -link displacement ($j = 0, \pm 1, \pm 2, \pm 3$)

- (2) construct **elemental** operators (translationally invariant)

$$B^F(x) = \phi_{ABC}^F \varepsilon_{abc} (\tilde{D}_i^{(p)}\tilde{\psi}(x))_{Aa\alpha} (\tilde{D}_j^{(p)}\tilde{\psi}(x))_{Bb\beta} (\tilde{D}_k^{(p)}\tilde{\psi}(x))_{Cc\gamma}$$

- flavor structure from isospin, color structure from gauge invariance

- (3) group-theoretical projections onto irreps of O_h

$$B_i^{\Lambda\lambda F}(t) = \frac{d_\Lambda}{g_{O_h^D}} \sum_{R \in O_h^D} D_{\lambda\lambda}^{(\Lambda)}(R)^* U_R B_i^F(t) U_R^+$$

- Grassmann package in Maple to do these calculations

- details in [PRD72, 094506 \(2005\)](#)

Three-quark elemental operators

- three-quark operator

$$\Phi_{\alpha\beta\gamma,ijk}^{ABC}(t) = \sum_{\vec{x}} \varepsilon_{abc} (\tilde{D}_i^{(p)} \tilde{\psi}(\vec{x}, t))_{a\alpha}^A (\tilde{D}_j^{(p)} \tilde{\psi}(\vec{x}, t))_{b\beta}^B (\tilde{D}_k^{(p)} \tilde{\psi}(\vec{x}, t))_{c\gamma}^C$$

- covariant displacements

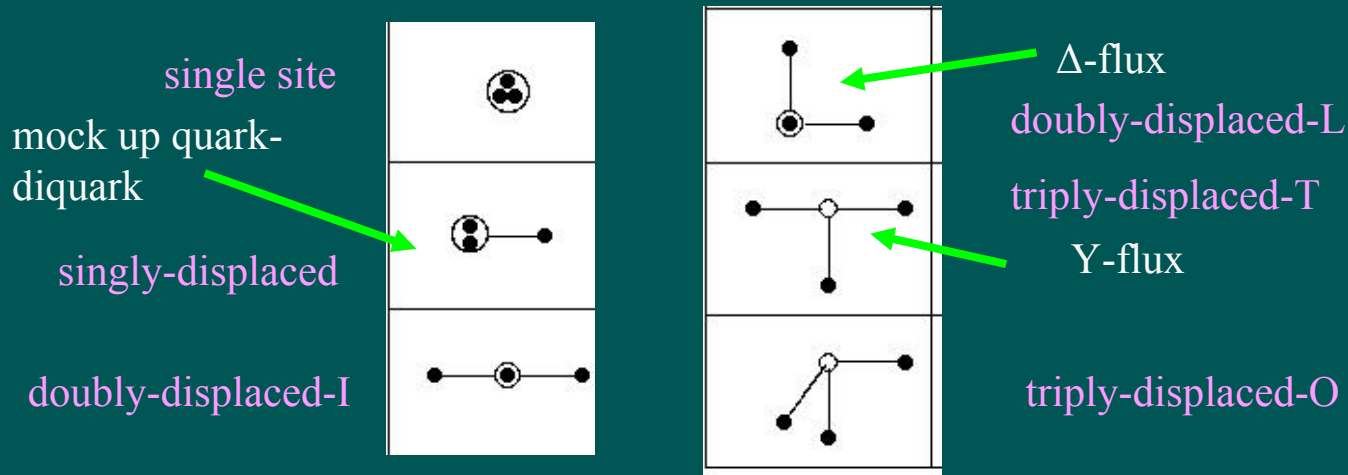

$$\tilde{D}_j^{(p)}(x, x') = \tilde{U}_j(x) \tilde{U}_j(x + \hat{j}) \cdots \tilde{U}_j(x + (p-1)\hat{j}) \delta_{x', x+p\hat{j}} \quad (j = \pm 1, \pm 2, \pm 3)$$

$$\tilde{D}_0^{(p)}(x, x') = \delta_{x', x}$$

| Baryon | Operator |
|---------------|---|
| Δ^{++} | $\Phi_{\alpha\beta\gamma,ijk}^{uuu}$ |
| Σ^+ | $\Phi_{\alpha\beta\gamma,ijk}^{uus}$ |
| N^+ | $\Phi_{\alpha\beta\gamma,ijk}^{uud} - \Phi_{\alpha\beta\gamma,ijk}^{duu}$ |
| Ξ^0 | $\Phi_{\alpha\beta\gamma,ijk}^{ssu}$ |
| Λ^0 | $\Phi_{\alpha\beta\gamma,ijk}^{uds} - \Phi_{\alpha\beta\gamma,ijk}^{dus}$ |
| Ω^- | $\Phi_{\alpha\beta\gamma,ijk}^{sss}$ |

Incorporating orbital and radial structure

- displacements of different lengths build up radial structure
- displacements in different directions build up orbital structure

- minimizes number of sources for quark propagators
- useful for mesons, tetraquarks, pentaquarks even!
- can even incorporate **hybrid mesons** operator (in progress)

Enumerating the three-quark operators

- lots of operators (too many!)

| | Δ^{++}, Ω^{-} | Σ^{+}, Ξ^{0} | N^{+} | Λ^{0} |
|--------------------|---------------------------|-----------------------|---------|---------------|
| Single-site | 20 | 40 | 20 | 24 |
| Singly-displaced | 240 | 624 | 384 | 528 |
| Doubly-displaced-I | 192 | 572 | 384 | 576 |
| Doubly-displaced-L | 768 | 2304 | 1536 | 2304 |
| Triply-displaced-T | 768 | 2304 | 1536 | 2304 |
| Triply-displaced-O | 512 | 1536 | 1024 | 1536 |

Spin identification and other remarks

- spin identification possible by pattern matching

| J | $n_{G_1}^J$ | $n_{G_2}^J$ | n_H^J |
|----------------|-------------|-------------|---------|
| $\frac{1}{2}$ | 1 | 0 | 0 |
| $\frac{3}{2}$ | 0 | 0 | 1 |
| $\frac{5}{2}$ | 0 | 1 | 1 |
| $\frac{7}{2}$ | 1 | 1 | 1 |
| $\frac{9}{2}$ | 1 | 0 | 2 |
| $\frac{11}{2}$ | 1 | 1 | 2 |
| $\frac{13}{2}$ | 1 | 2 | 2 |
| $\frac{15}{2}$ | 1 | 1 | 3 |
| $\frac{17}{2}$ | 2 | 1 | 3 |

total numbers of operators assuming two different displacement lengths

| Irrep | Δ, Ω | N | Σ, Ξ | Λ |
|----------|------------------|-----|---------------|-----------|
| G_{1g} | 221 | 443 | 664 | 656 |
| G_{1u} | 221 | 443 | 664 | 656 |
| G_{2g} | 188 | 376 | 564 | 556 |
| G_{2u} | 188 | 376 | 564 | 556 |
| H_g | 418 | 809 | 1227 | 1209 |
| H_u | 418 | 809 | 1227 | 1209 |

- total numbers of operators is huge \rightarrow uncharted territory
- ultimately must face two-hadron scattering states

Single-site operators

- choose Dirac-Pauli convention for γ -matrices

- 20 independent single-site Δ^{++} elemental operators:

$$\Delta_{\alpha\beta\gamma} = \epsilon_{abc} \bar{u}_{a\alpha} \bar{u}_{b\beta} \bar{u}_{c\gamma}, \quad (\alpha \leq \beta \leq \gamma)$$

- 20 independent single-site N^+ elemental operators:

$$N_{\alpha\beta\gamma} = \epsilon^{abc} (\bar{u}_{a\alpha} \bar{u}_{b\beta} \bar{d}_{c\gamma} - \bar{d}_{a\alpha} \bar{u}_{b\beta} \bar{u}_{c\gamma}), \quad (\alpha \leq \beta, \alpha < \gamma)$$

- 40 independent single-site Σ^+ elemental operators:

$$\Sigma_{\alpha\beta\gamma} = \epsilon_{abc} \bar{u}_{a\alpha} \bar{u}_{b\beta} \bar{s}_{c\gamma} \quad (\alpha \leq \beta)$$

- 24 independent single-site Λ^0 elemental operators:

$$\Lambda_{\alpha\beta\gamma} = \epsilon_{abc} (\bar{u}_{a\alpha} \bar{d}_{b\beta} \bar{s}_{c\gamma} - \bar{d}_{a\alpha} \bar{u}_{b\beta} \bar{s}_{c\gamma}) \quad (\alpha < \beta)$$

Δ^{++} single-site operators

| Irrep | Row | DP Operators |
|----------|-----|---------------------------------|
| G_{1g} | 1 | $\Delta_{144} - \Delta_{234}$ |
| G_{1g} | 2 | $-\Delta_{134} + \Delta_{233}$ |
| G_{1u} | 1 | $\Delta_{124} - \Delta_{223}$ |
| G_{1u} | 2 | $-\Delta_{114} + \Delta_{123}$ |
| H_g | 1 | Δ_{222} |
| H_g | 2 | $-\sqrt{3} \Delta_{122}$ |
| H_g | 3 | $\sqrt{3} \Delta_{112}$ |
| H_g | 4 | $-\Delta_{111}$ |
| H_g | 1 | $\sqrt{3} \Delta_{244}$ |
| H_g | 2 | $-\Delta_{144} - 2\Delta_{234}$ |
| H_g | 3 | $2\Delta_{134} + \Delta_{233}$ |
| H_g | 4 | $-\sqrt{3} \Delta_{133}$ |

| Irrep | Row | DP Operators |
|-------|-----|---------------------------------|
| H_u | 1 | $\sqrt{3} \Delta_{224}$ |
| H_u | 2 | $-2\Delta_{124} - \Delta_{223}$ |
| H_u | 3 | $\Delta_{114} + 2\Delta_{123}$ |
| H_u | 4 | $-\sqrt{3} \Delta_{113}$ |
| H_u | 1 | Δ_{444} |
| H_u | 2 | $-\sqrt{3} \Delta_{344}$ |
| H_u | 3 | $\sqrt{3} \Delta_{334}$ |
| H_u | 4 | $-\Delta_{333}$ |

Single-site N_{\pm} operators

| Irrep | Row | DP Operators |
|----------|-----|----------------------------------|
| G_{1g} | 1 | N_{122} |
| G_{1g} | 2 | $-N_{112}$ |
| G_{1g} | 1 | $N_{144} - N_{243}$ |
| G_{1g} | 2 | $-N_{134} + N_{233}$ |
| G_{1g} | 1 | $N_{144} - 2N_{234} + N_{243}$ |
| G_{1g} | 2 | $N_{134} - 2N_{143} + N_{233}$ |
| G_{1u} | 1 | N_{142} |
| G_{1u} | 2 | $-N_{132}$ |
| G_{1u} | 1 | N_{344} |
| G_{1u} | 2 | $-N_{334}$ |
| G_{1u} | 1 | $2N_{124} - N_{142} - 2N_{223}$ |
| G_{1u} | 2 | $-2N_{114} + 2N_{123} - N_{132}$ |

| Irrep | Row | DP Operators |
|-------|-----|---------------------------------|
| H_g | 1 | $\sqrt{3} N_{244}$ |
| H_g | 2 | $-N_{144} - N_{234} - N_{243}$ |
| H_g | 3 | $N_{134} + N_{143} + N_{233}$ |
| H_g | 4 | $-\sqrt{3} N_{133}$ |
| H_u | 1 | $\sqrt{3} N_{224}$ |
| H_u | 2 | $-2N_{124} + N_{142} - N_{223}$ |
| H_u | 3 | $N_{114} + 2N_{123} - N_{132}$ |
| H_u | 4 | $-\sqrt{3} N_{113}$ |

Quark-field and link-variable smearing issues

Run parameters

- run parameters for all results presented here
 - $12^3 \times 48$ anisotropic lattice
 - Wilson gauge, Wilson fermion actions
 - lattice spacings $a_s \sim 0.1 \text{ fm}$, $a_s / a_t \sim 3.0$
 - quark masses such that $m_\pi \sim 700 \text{ MeV}$
 - quenched
 - correlator matrices averaged over irrep rows
 - use of opposite-parity time-reversed propagators to double statistics
 - number of configurations used
 - 50 for operator smearing tests
 - 200 for operator prunings

Quark- and gauge-field smearing

- smeared quark and gluon fields → dramatically reduced coupling with short wavelength modes

- **link-variable** smearing (stout links PRD**69**, 054501 (2004))

- define $C_\mu(x) = \sum_{\pm(v \neq \mu)} \rho_{\mu v} U_v(x) U_\mu(x + \hat{v}) U_v^\dagger(x + \hat{\mu})$

- spatially isotropic $\rho_{jk} = \rho, \quad \rho_{4k} = \rho_{k4} = 0$

- exponentiate traceless Hermitian matrix

$$\Omega_\mu = C_\mu U_\mu^+ \quad Q_\mu = \frac{i}{2} (\Omega_\mu^+ - \Omega_\mu) - \frac{i}{2N} \text{Tr}(\Omega_\mu^+ - \Omega_\mu)$$

- iterate

$$U_\mu^{(n+1)} = \exp(iQ_\mu^{(n)}) U_\mu^{(n)}$$

$$U_\mu \rightarrow U_\mu^{(1)} \rightarrow \dots \rightarrow U_\mu^{(n)} \equiv \tilde{U}_\mu$$

- **quark**-field smearing (covariant Laplacian uses smeared gauge field)

$$\tilde{\psi}(x) = \left(1 + \frac{\sigma_s^2}{4n_\sigma} \tilde{\Delta}^2 \right)^{n_\sigma} \psi(x)$$

- parameters to tune: $\sigma_s, n_\sigma, \rho, n_\rho$

Quark-field smearing tuning

- focus on three particular operators for smearing tests
 - a single-site operator O_{SS} in the G_{1g} irrep
 - a singly-displaced operator O_{SD} with a particular choice of Dirac indices and 3-link displacement length
 - a triply-displaced-T operator O_{TDT} with a particular choice of the Dirac indices (3-link displacement lengths)
- define effective mass as usual $M_i(t) = \ln\left(\frac{C_{ii}(t)}{C_{ii}(t+a_t)}\right)$
- use $M_i(t=4a_t)$ to compare different quark-field smearings
- smeared links $\rho n_\rho = 2.5, n_\rho = 16$ since displaced operators noisy

$$n_\sigma = 1, 2, 4, 8, \\ 16, 32, 64$$

Link-variable smearing tuning

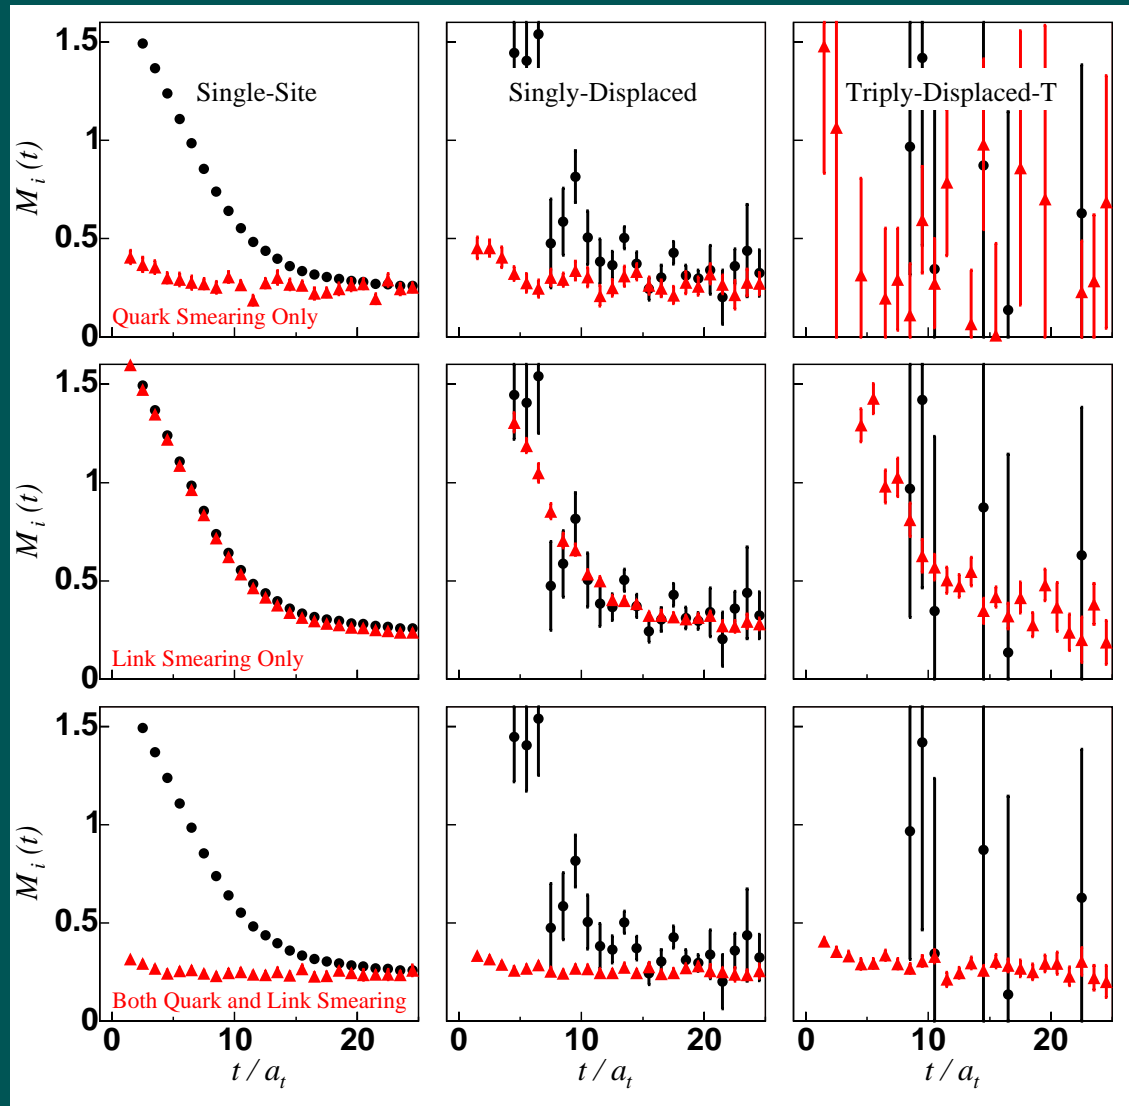

- first, used the effective mass $E(t=0)$ associated with the static quark-antiquark potential at spatial separation $R = 5a_s \sim 0.5 \text{ fm}$
- found that link-smearing did not appreciably alter values of baryon effective masses, but had dramatic effect on *variance*
- compared relative jackknife error $\eta_i(t=4a_t)$ of $M_i(t=4a_t)$ for different link-smearing parameters ($\sigma_s = 4.0, n_\sigma = 32$)
- lesson learned: preferred parameters from static potential produce smallest errors in baryon effective masses

$$n_\rho = 1, 2, 4, 8, 16, 32$$

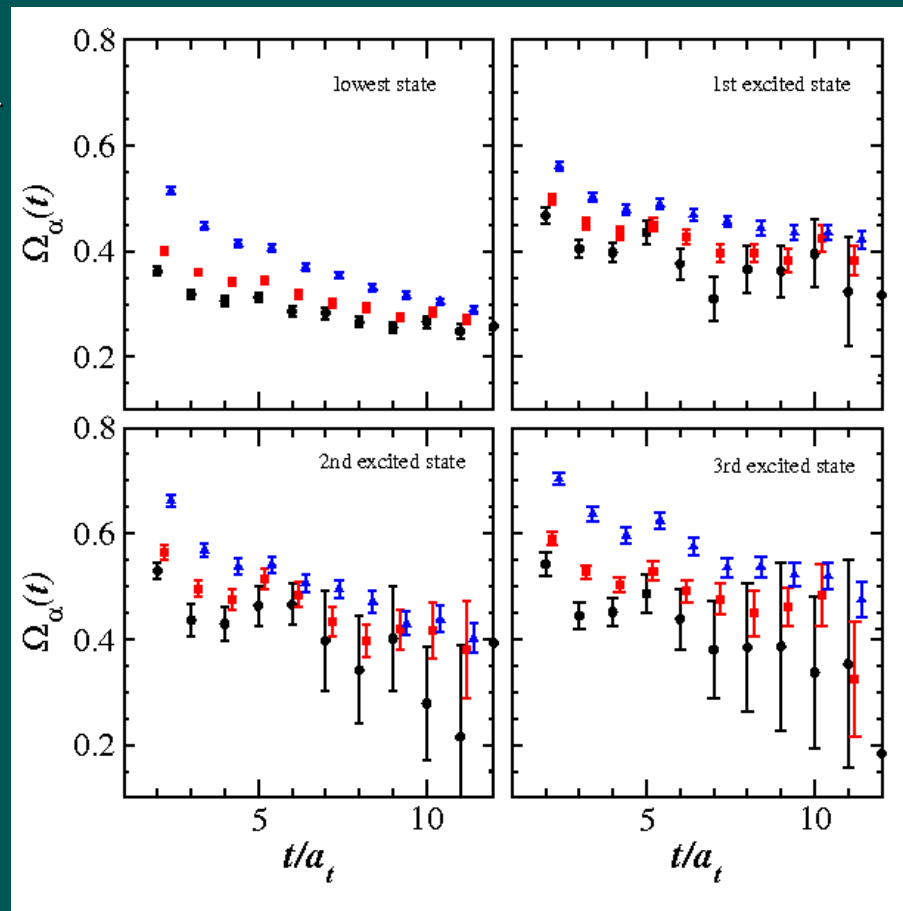

Importance of smearing

- Nucleon G1g channel
- effective masses of the 3 selected operators
- noise reduction from link variable smearing, especially for displaced operators
- quark-field smearing reduces couplings to high-lying states
 - $\sigma_s = 4.0, n_\sigma = 32$
 - $n_\rho \rho = 2.5, n_\rho = 16$
- effect on excited states shows $\sigma_s = 3.0$ better

Smearing and excited states

- previous tests involved lowest state only
- important to tune smearing for excited states as well
- lowest 4 principal effective masses for 10x10 matrix of DDI G_{1g} operators shown
 - same link smearing $\rho n_\rho = 2.5, n_\rho = 16$
 - quark-field smearings $\sigma_s = 2.0$ (blue), 3.0 (red), 4.0 (black) $n_\sigma = 32$
 - $\rho n_\rho = 5.0, n_\rho = 32$ with $\sigma_s = 4.0$ did not reduce errors
- preferred: $n_\sigma = 32, \sigma_s = 3.0$

Smearing summary

- From our quenched study of the G_{1g} nucleon channel on small lattices $12^3 \times 48$ for $a_s \sim 0.1 \text{ fm}$ and $a_s/a_t \sim 3.0$ and $m_\pi \sim 700 \text{ MeV}$, the preferred smearing parameters are

$$\rho n_\rho = 2.5, n_\rho = 16$$

$$n_\sigma = 32, \sigma_s = 3.0$$

- factors still to consider:
 - evidence for same smearing for other irreps
 - expect same smearing for other isospin channels
 - dependence on lattice spacing
 - dependence on quark mass

Operator pruning issues

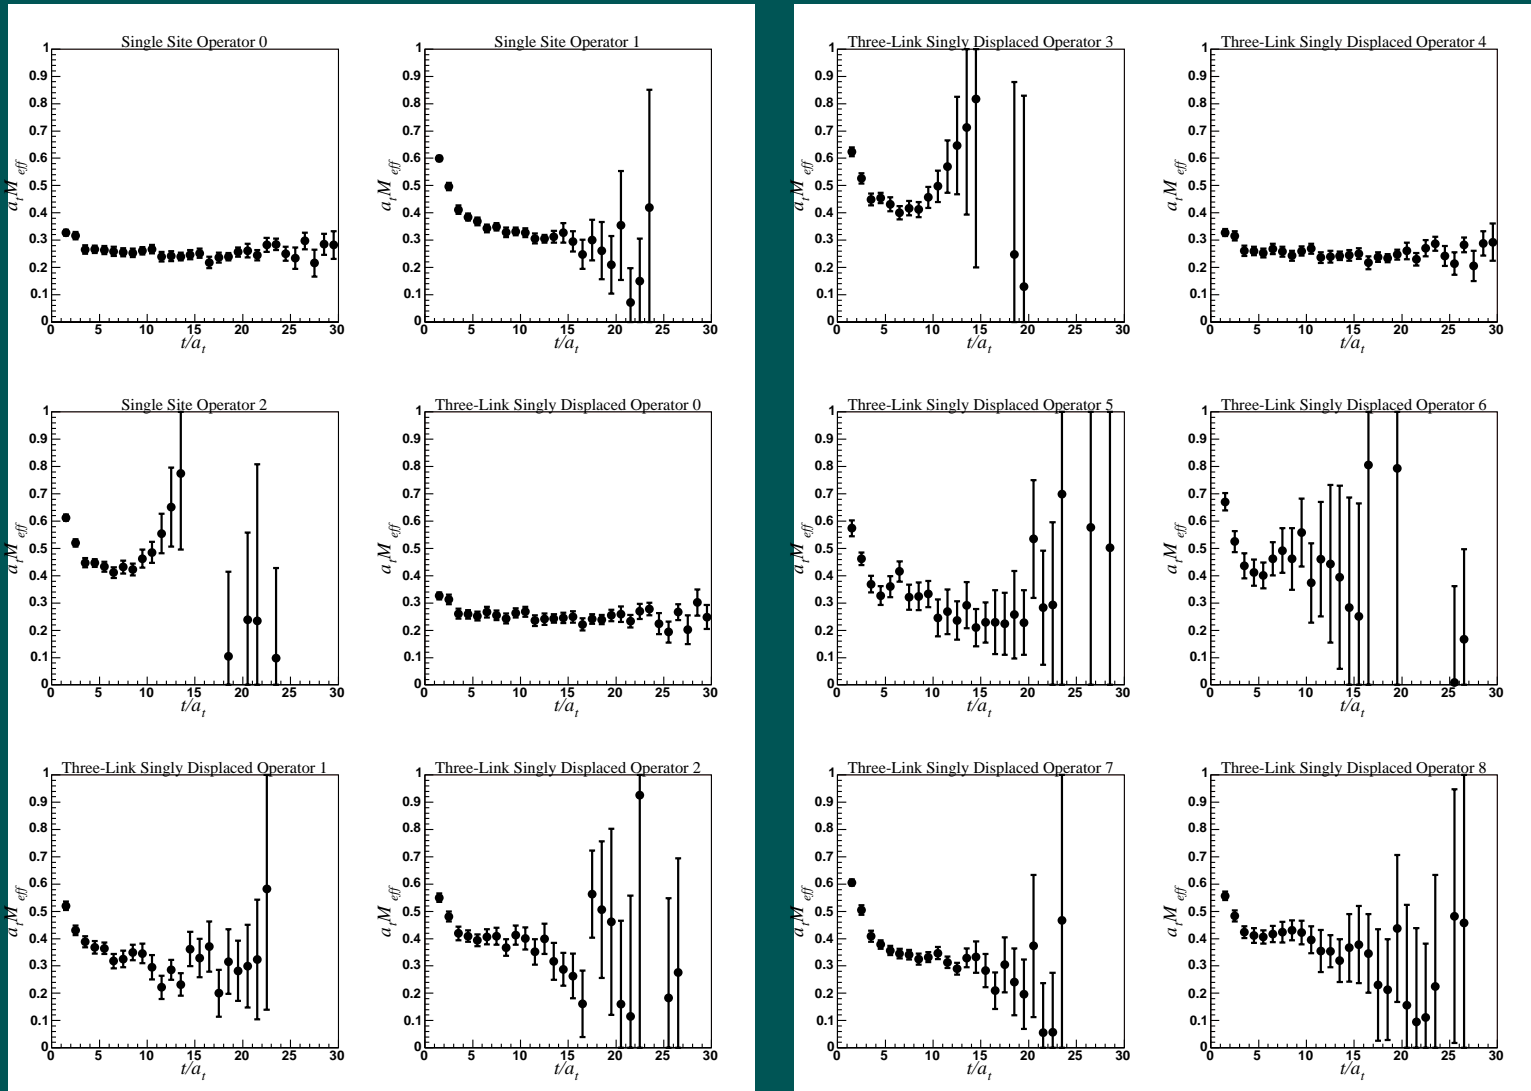

Operator plethora

- Number of N^+ operators given below (1 displacement length)
 - total of 179 operators in G_{1g} channel

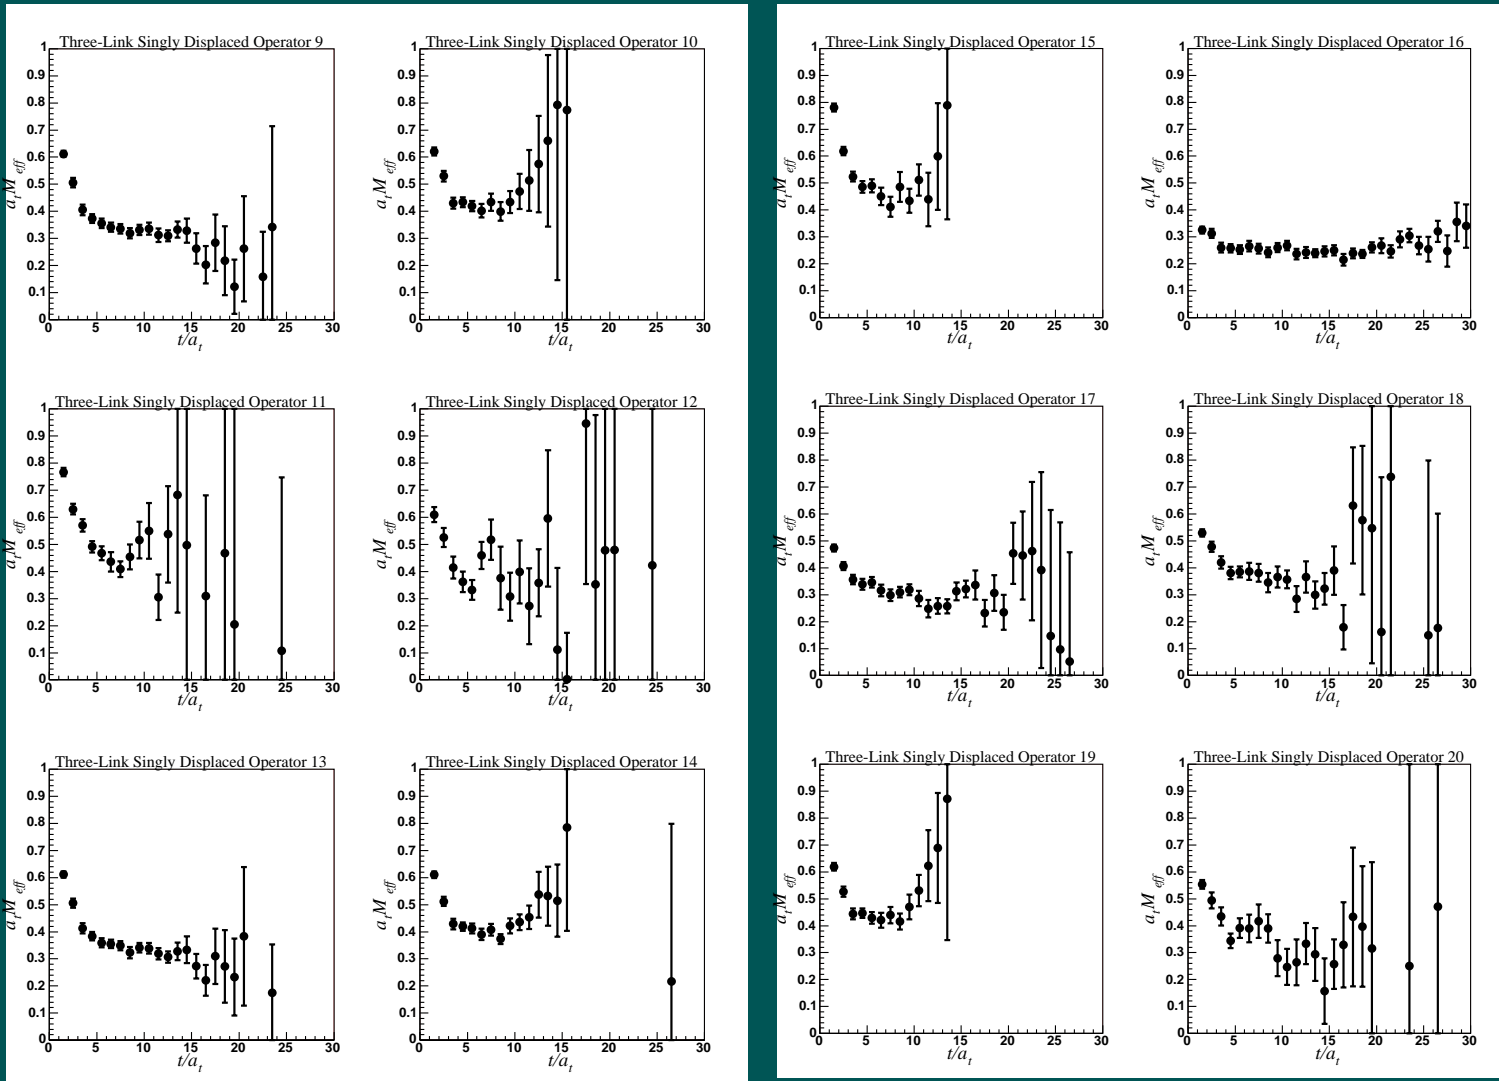

| | G_{1g} | G_{2g} | H_g |
|--------------------|----------|----------|-------|
| Single-site | 3 | 0 | 1 |
| Singly-displaced | 24 | 8 | 32 |
| Doubly-displaced-I | 24 | 8 | 32 |
| Doubly-displaced-L | 64 | 64 | 128 |
| Triply-displaced-T | 64 | 64 | 128 |

- since 179x179 matrix too large to be practical, operator pruning is clearly necessary
- will focus on G_{1g} channel first

Operator plethora (G1g Nucleon)

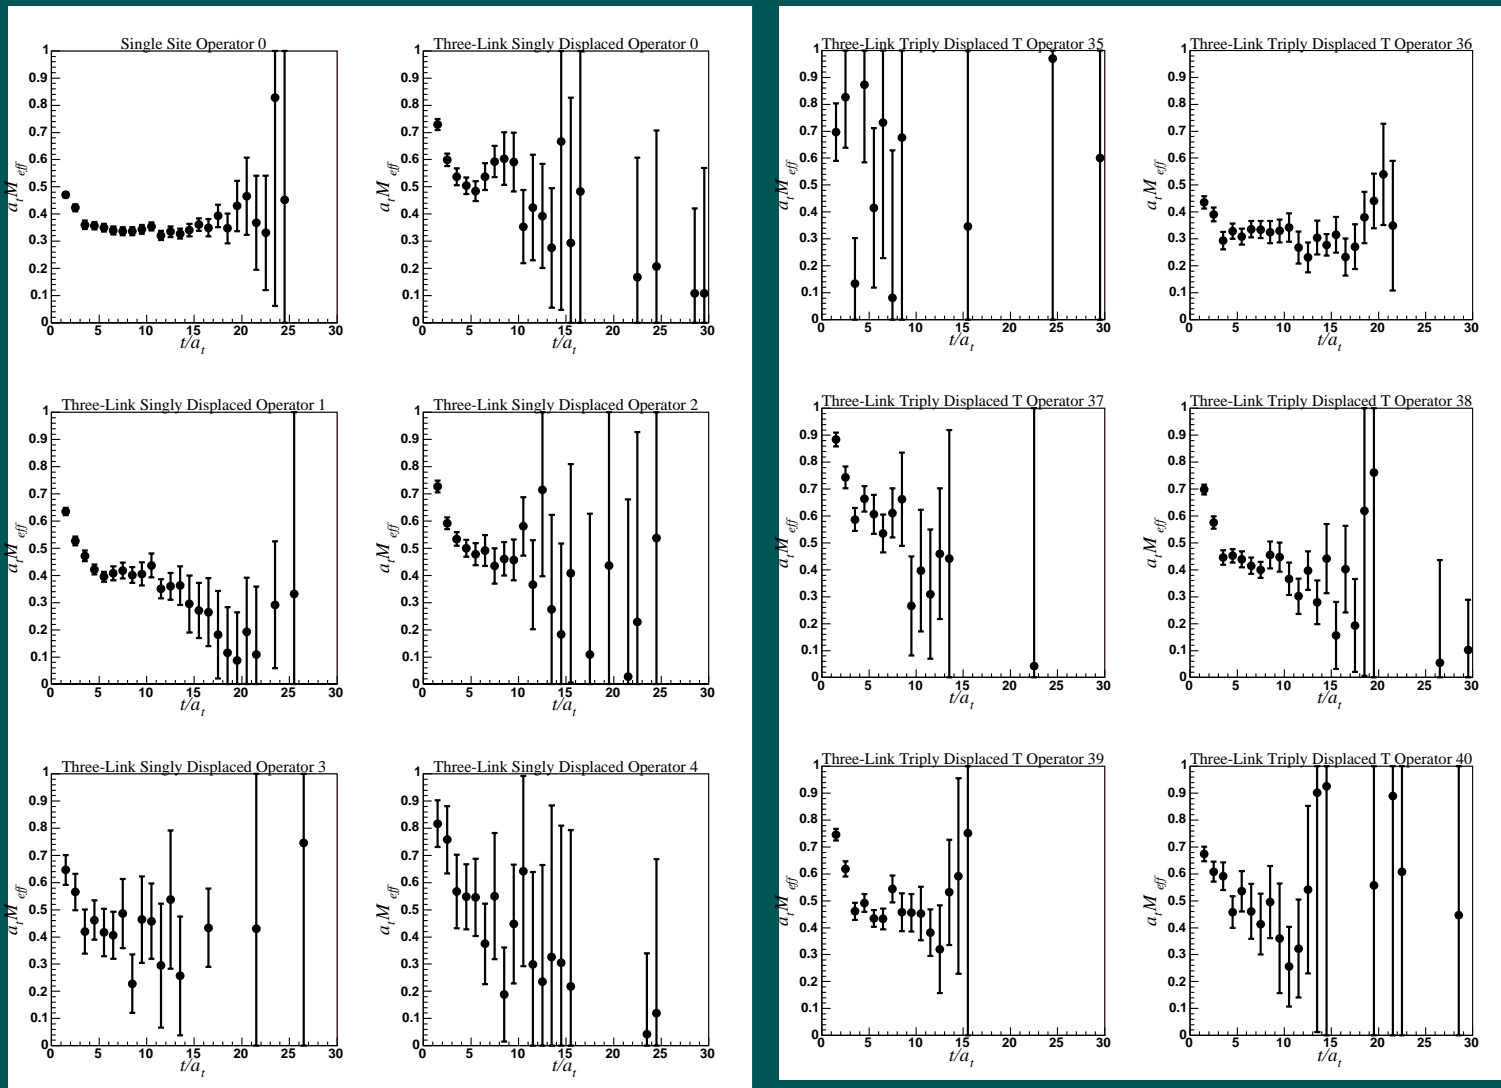

G1g nucleon operators

G2g nucleon operators

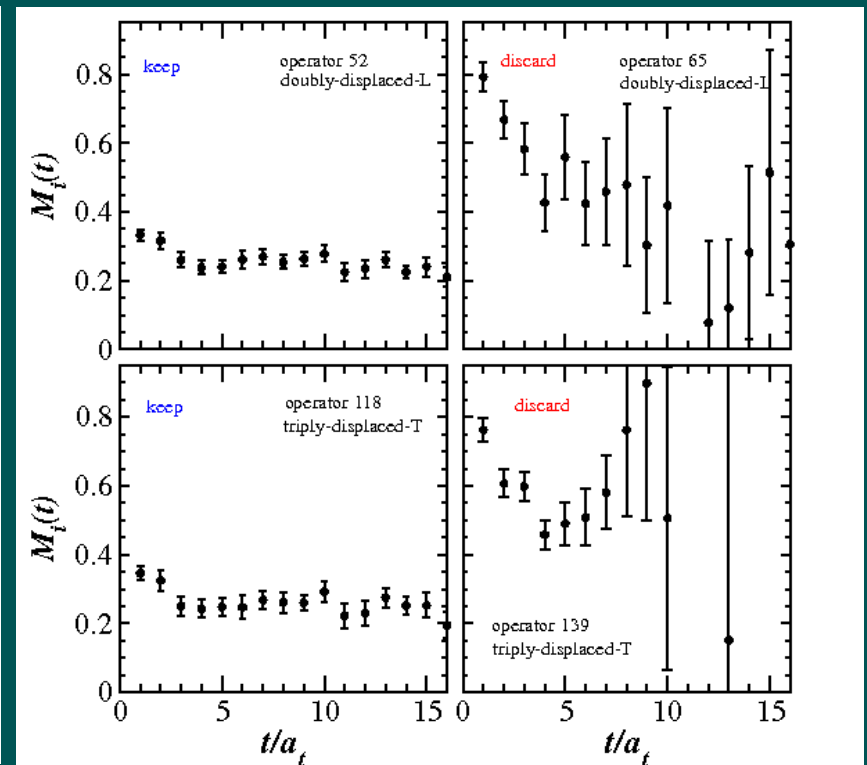

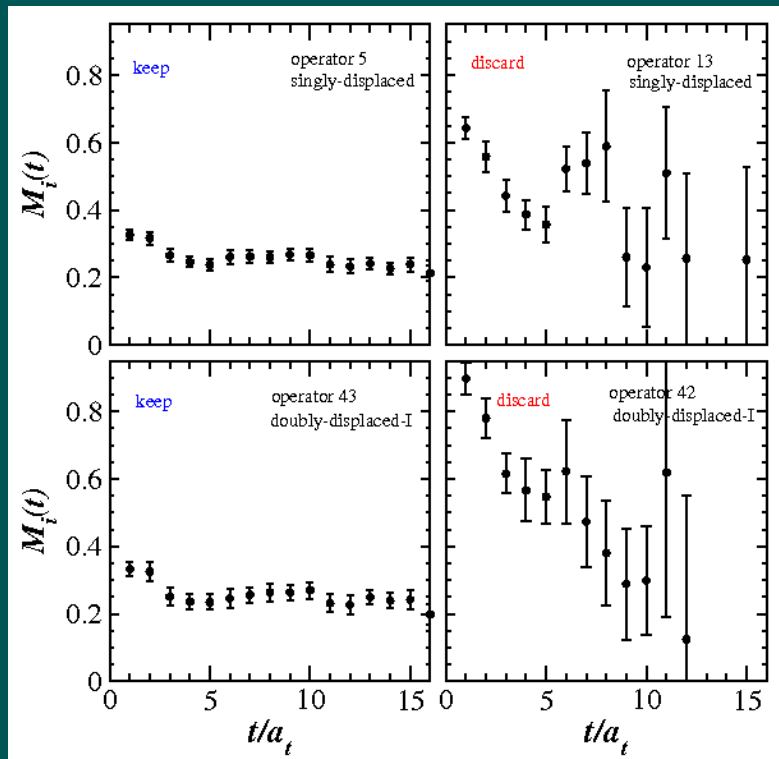

Hu nucleon operators

Pruning: step one

- look at effective masses of diagonal elements of correlation matrix and discard noisy operators
- examples shown below ($\rho n_\rho = 2.5, n_\rho = 16, n_\sigma = 32, \sigma_s = 4.0$ used)
- all 179 effective masses

Pruning: step one (continued)

- retain 64 operators out of the 179
 - SS: 0, 1, 2
 - SD: 3, 5, 6, 8, 10, 12, 14, 17, 19, 20, 22, 24, 25
 - DDI: 27, 29, 30, 31, 33, 36, 38, 41, 43, 44, 45, 48
 - DDL: 52, 54, 56, 57, 58, 59, 60, 61, 62, 72, 74, 76, 78, 85, 88, 94, 97, 98, 105, 110
 - TDT: 116, 118, 119, 124, 125, 126, 132, 134, 136, 138, 149, 158, 162, 163, 169, 174

Noise, noise, noise, noise

- noise is the enemy!!
 - intrinsic noise in each operator
 - presence of small singular values indicates operator set not “independent enough” → noise can creep in

- examine renormalized matrix at early time $t=1$

$$\hat{C}_{ij}(1) = C_{ij}(1) / \sqrt{C_{ii}(1)C_{jj}(1)}$$

- sort operators in order of increasing noise
- keep 6 least noisiest operators of each kind (SD,DDI,...) which yield acceptable matrix condition number
- from above set, choose 25 operators which still yield acceptable matrix condition number
- try to keep different operator types if condition number allows

Milestone: principal effective masses

- G1g nucleons (16x16 matrix) using 200 configurations
- world record: 9 levels extracted (even more possible!)

Hg nucleon channel

Hu nucleon channel

Future work

- three-quark operator pruning to be completed
 - all irreps, all isospin channels
 - different displacement lengths
- include mesons (in progress)
- include multi-hadron operators
 - stochastic all-to-all propagators with dilution, low eigenvectors
 - will also facilitate disconnected diagrams
- goal: operator technology ready to go when unquenched simulations near realistically-light quark masses become possible
- LHPC recently was awarded 1/6 of QCDOC to generate configurations on large lattices with dynamical quarks such that pion mass around 300 MeV

Summary

- progress report on ongoing efforts of LHPC to extract hadron spectrum with large sets of extended operators
 - need for correlation matrices of good operators
 - spin identification must be addressed
 - multi-hadron operators will become important
- exploration of 3-quark baryon operators nearly done
- study of meson operators beginning
- major milestone reached: can extract 9 or more states!!
- ultimately, MC updating with realistically light quark masses needed
- very challenging calculations
 - will keep hammering at it!
