

# Low-energy hadronic cross section measurements at BaBar, and implication for the $g-2$ of the muon

---

E.Solodov for the BaBar collaboration

Budker INP SB RAS, Novosibirsk, Russia

HADRON2015, Newport News, USA

# PEP-II e+e- collider, Babar detector

$E_+ = 3.1 \text{ GeV}, E_- = 9 \text{ GeV}$

$E_{CM} = M(Y(4S)) = 10.6 \text{ GeV}$   
 2000 - 2008 yrs  
 $\Delta L = 500 \text{ fb}^{-1}$   
 $N(B) = 10^9$

## BaBar

$$\frac{d\sigma(s, x)}{dx d(\cos\theta)} = W(s, x, \theta) \cdot \sigma_0(s(1-x)),$$

$$W(s, x, \theta) = \frac{\alpha}{\pi x} \left( \frac{2 - 2x + x^2}{\sin^2 \theta} - \frac{x^2}{2} \right), \quad x = \frac{2E_\gamma}{\sqrt{s}}$$

$\theta$  - photon polar angle in c.m.

# ISR study at BaBar

- ISR at BaBar gives competitive (**even dominates!**) statistics
- BaBar has excellent capability for ISR study
- Many major hadronic processes have been studied

# BaBar measurements summary

$a_\mu$  integral

$$a_\mu^{\text{had}} = \frac{\alpha^2}{3 \cdot \pi^2} \int_{4m_\pi^2}^{\infty} ds \cdot \frac{K(s)}{s} \cdot R(s)$$

$$R(s) = \frac{\sigma(e^+e^- \rightarrow \gamma^* \rightarrow \text{hadrons})}{\sigma(e^+e^- \rightarrow \mu^+\mu^-)}$$

0.5-2% syst. errors

4-15% syst. errors

To calculate  $R$  in the energy range 1-2 GeV the processes  $\pi^+\pi^-3\pi^0$ ,  $\pi^+\pi^-4\pi^0$ ,  $K_S K_L$ ,  $K_S K_L \pi^+\pi^-$ ,  $K_S K^+ \pi^-\pi^0$  are under study:  $\pi^+\pi^-2\pi^0$  will come soon. Work is in progress for  $K_S K_L \pi^0 \pi^0$ ,  $K_S K_L \pi^0$

# Contribution of missing channels to $a_\mu$

SM-to-experiment comparison [in units  $10^{-10}$ ] (M. Davier et al., EPJC71(2011)1515)

QED	116 584 71.81	$\pm 0.02$

Missing channels contribute  $5.98 \pm 0.42$  or  $12.46 \pm 0.76$  if  $\sqrt{s} < 2.0$  GeV

Contribution from  $KK\pi$ ,  $KK2\pi$ ,  $(2\pi3\pi^0, 2\pi4\pi^0, 7\pi\dots)$  added using iso-spin relations (in particular, using measured  $K^+K^-\pi^+\pi^-$  ( $\pi^0\pi^0$ ) channels)

# The cross section comparison – BaBar data

Naively expect:  $N(K^+K^-\pi^+\pi^-) = 2 N(K^+K^-\pi^0\pi^0)$

Many intermediate states break the relation.

**Study of intermediate states is important!**

# Decomposition of $K^+K^-\pi^+\pi^-$ mass spectrum

$K^+K^-\pi^+\pi^-$

$K^{*0}(892)K\pi$

$K^+K^-\rho(770)$

$\phi\pi^+\pi^-$

$K_2^{*0}(1430)K\pi$

Tables with cross sections  
(corrected for BF) are provided

Phys. Rev. D 86, 012008 (2012)

$$e^+e^- \rightarrow K_S K_L, K_S K_L \pi^+ \pi^-, K_S K_S \pi^+ \pi^- (K^+ K^-)$$

---

We present (with more details) results on the study of the processes:

$$e^+e^- \rightarrow K_S K_L$$

$$e^+e^- \rightarrow K_S K_L \pi^+ \pi^-$$

$$e^+e^- \rightarrow K_S K_S \pi^+ \pi^-$$

$$e^+e^- \rightarrow K_S K_S K^+ K^-$$

Published *Phys. Rev. D* 89, 092002 (2014)

And new (preliminary) results on the process

$$e^+e^- \rightarrow K_S K^{*+} \pi^{*-} \pi^0, K_S K^{*+} \pi^{*-} \eta$$

ready for publication

Based on 469 fb<sup>-1</sup> integrated luminosity.

# $K_S$ selection (in $\pi^+\pi^-$ decay)

Loop over all  $K_S$  candidates with ISR photon with  $E_\gamma > 3$  GeV, and select events with:

- Good quality  $K_S$  coming from IP
- No electron ID for either charged track

Simulation  
of  $\phi\gamma \rightarrow K_S K_L \gamma$   
compare to data

Dominated by  $\phi\gamma \rightarrow K_S K_L \gamma$  process if require **NO** additional tracks from IP

# $e^+e^- \rightarrow \phi \gamma \rightarrow K_S K_L \gamma$ (without $K_L$ detection)

$$\begin{aligned} E_0 &= E^+ + E^- \\ \vec{p}_0 &= \vec{p}^+ + \vec{p}^- \\ \vec{p}_\gamma &= n E_\gamma \end{aligned}$$

Assuming  $e^+e^- \rightarrow \phi\gamma$  reaction  
Use  $\phi$  mass to get  $E_{\gamma\text{ISR}}$

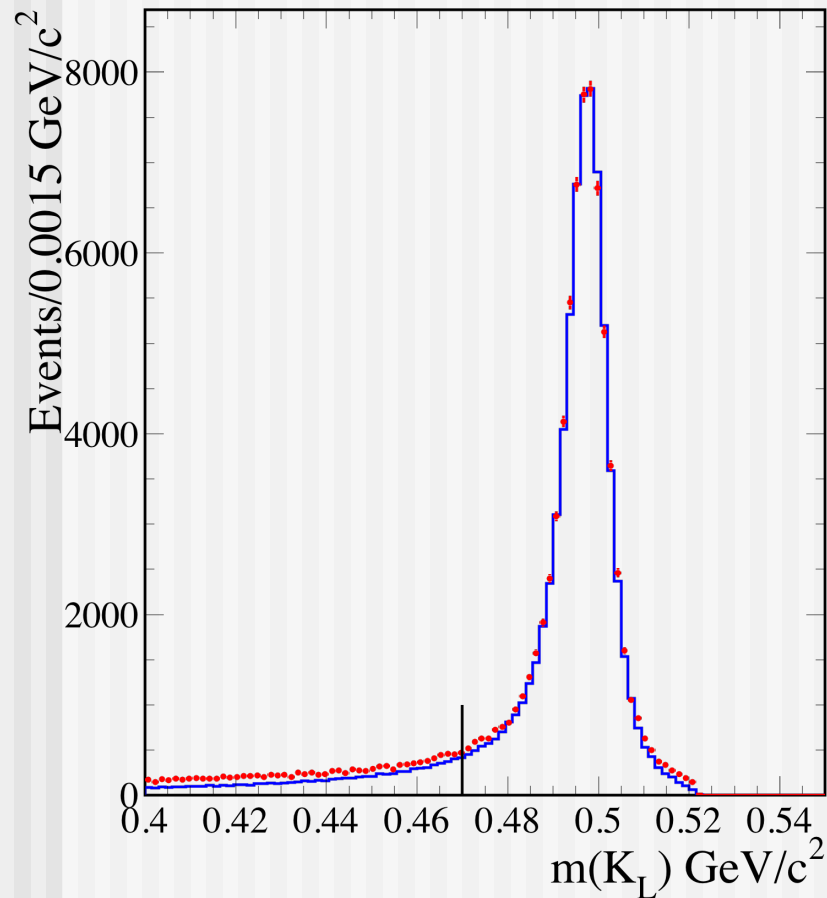

$$E_\gamma^c = \frac{E_0^2 - p_0^2 - m_\phi^2}{2(E_0 - \vec{p}_0 \cdot \vec{n}_\gamma)}$$

Using energy-momentum conservation and detected  $K_S$   
we determine  $K_L$  mass and direction:

$$m^2(K_L) = \left(E^+ + E^- - E_\gamma^c - E_{K_S}\right)^2 - \left(p^+ + p^- - p_\gamma^c - p_{K_S}\right)^2$$

Using these events we can study  $K_L$  detection.

# $K_L$ mass using $\phi$ mass constraint

MC normalized to two bins at peak

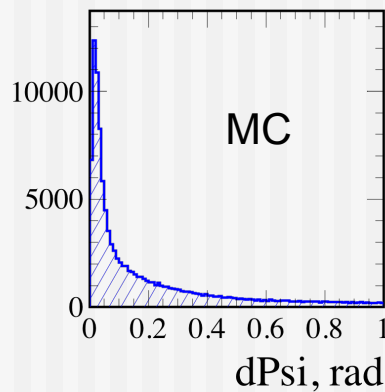

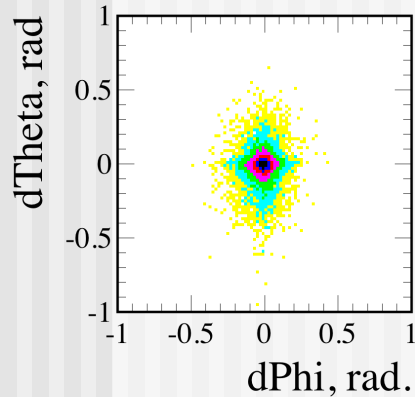

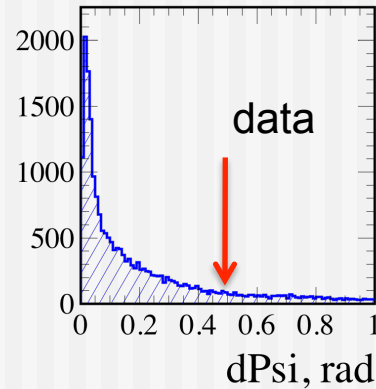

**Very low background!**

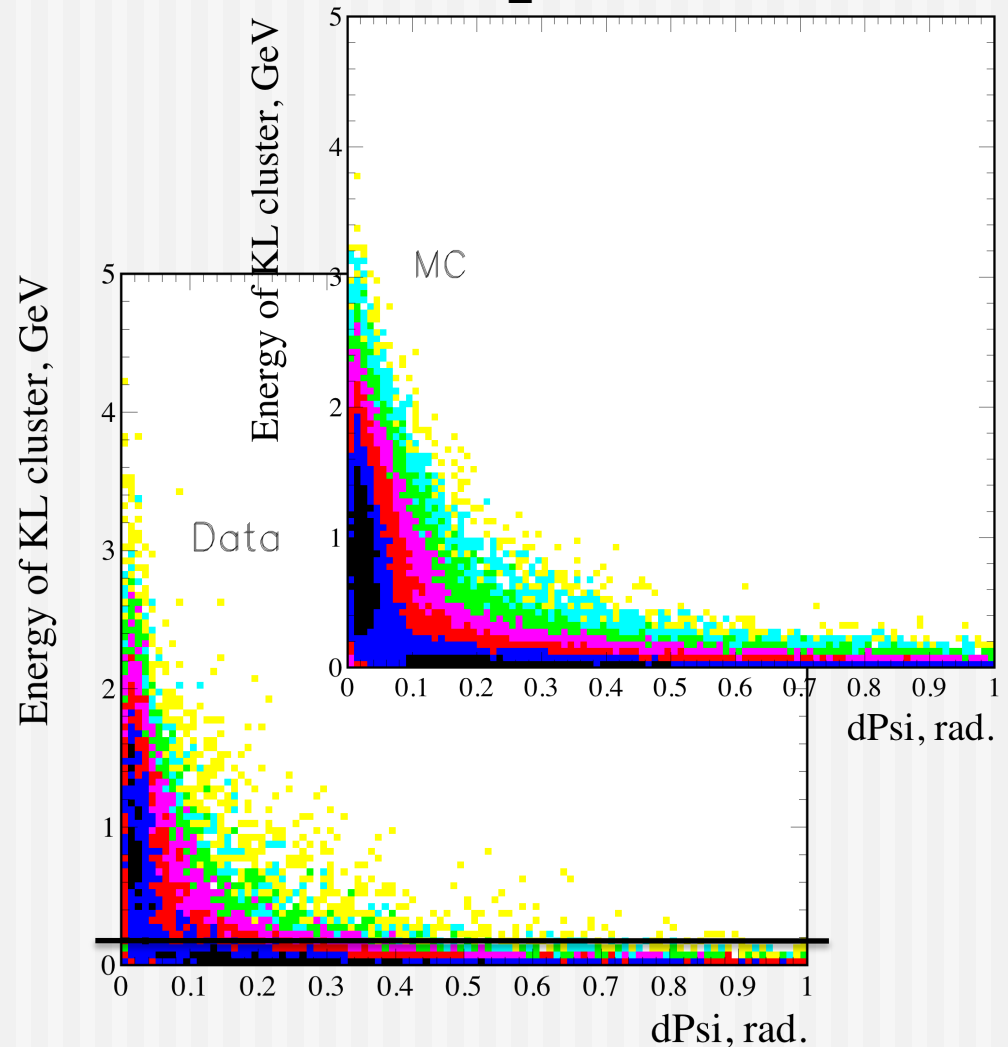

After background subtraction (5.6%) we have **81012 $\pm$ 285** events (**447434 $\pm$ 669** MC). We estimate  $\sim 0.5\%$  systematic error for background subtraction uncertainty.

# How $K_L$ cluster in Calorimeter looks like?

1. Search for EMC cluster closest to  $K_L$  direction:

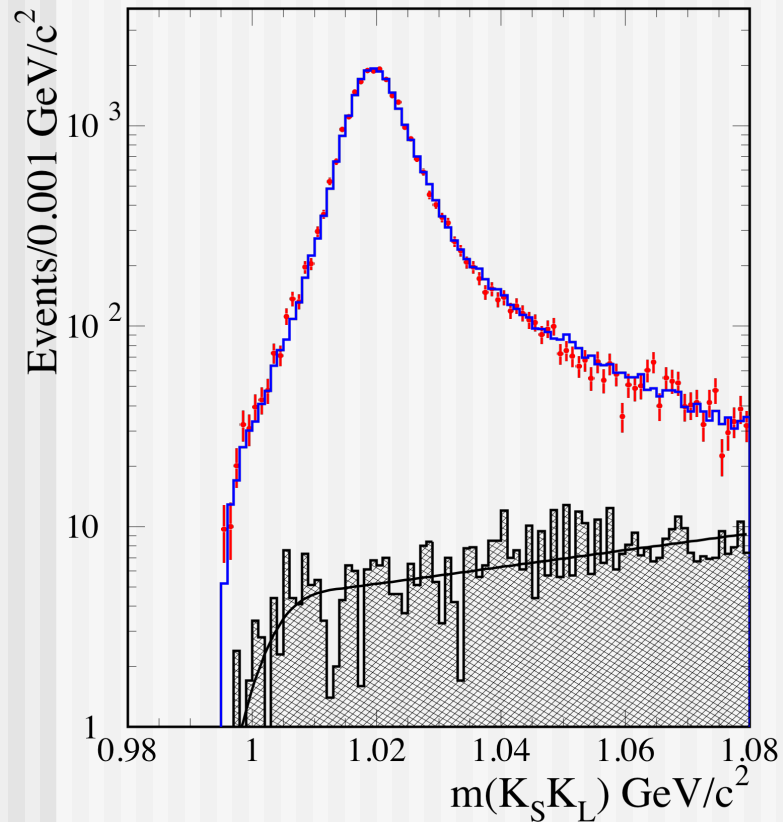

$E(K_L) > 0.2$  GeV cut is set  
Apply loose cut  $d\Psi < 0.5$

$$\text{Data/MC} = 0.9394 \pm 0.0052 (0.6\%)$$

# $\phi$ signal in $e^+e^- \rightarrow K_S K_L$ reaction

Use events with  $\chi^2 < 15$  and reconstructed parameters of  $K_S$  and  $K_L$  to calculate  $m(K_S K_L)$

# Fit to $\phi$ parameters

Fit:

$$\begin{aligned} \sigma_0 &= 1409 \pm 33 \pm 42 \pm 15 \text{ nb} \\ m &= 1019.462 \pm 0.042 \pm 0.050 \pm 0.025 \text{ MeV}/c^2 \\ \Gamma_0 &= 4.205 \pm 0.103 \pm 0.050 \pm 0.045 \text{ MeV} \end{aligned}$$

**CMD-2**

$$\begin{aligned} \sigma_0 &= 1376 \pm 6 \pm 23 \text{ nb} \\ m &= 1019.483 \pm 0.011 \pm 0.025 \text{ MeV}/c^2 \\ \Gamma_0 &= 4.280 \pm 0.033 \pm 0.025 \text{ MeV} \\ \Gamma_{ee} &= 1.235 \pm 0.006 \pm 0.022 \text{ keV} \end{aligned}$$

**PDG2010-2012**

$$\begin{aligned} m &= 1019.455 \pm 0.020 \text{ MeV}/c^2 \\ \Gamma_0 &= 4.26 \pm 0.04 \text{ MeV} \\ \Gamma_{ee} &= 1.27 \pm 0.04 \text{ keV} \\ B_{K_S K_L} &= 0.342 \pm 0.004 \\ B_{ee} \cdot B_{K_S K_L} &= 1.006 \pm 0.016 \end{aligned}$$

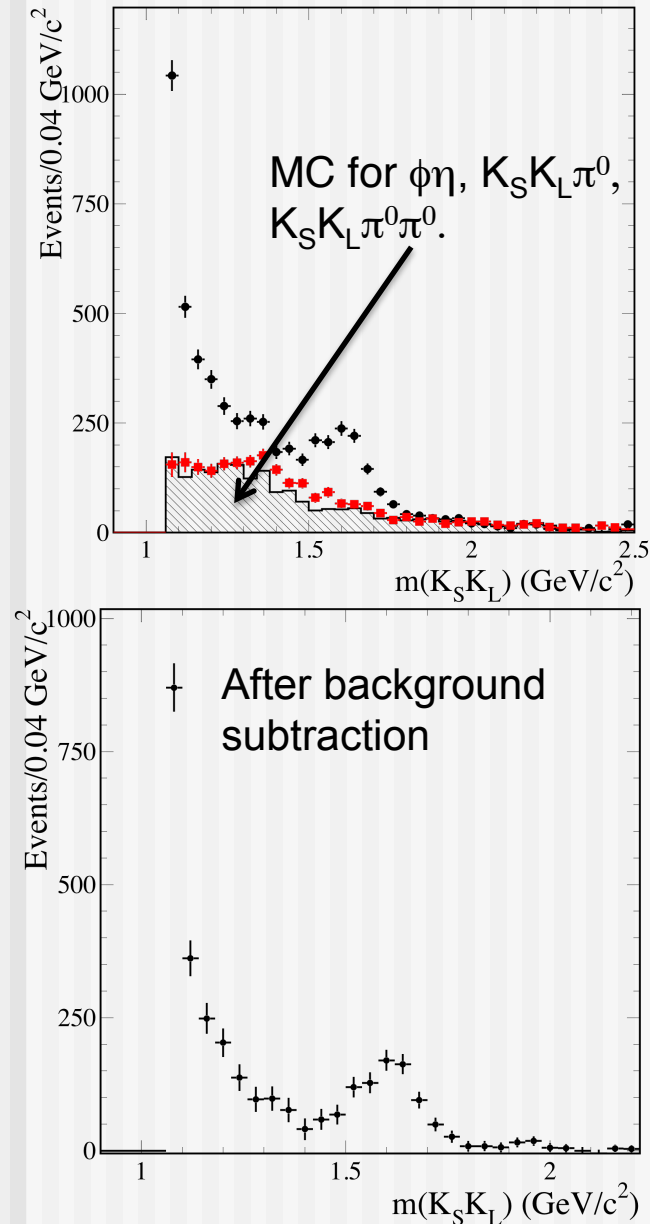

Systematic uncertainty:

$K_L$ efficiency (+ $\chi^2$ )	0.6%
BGFilter efficiency	2.3%
$K_S$ efficiency	1.0%
ISR photon	0.5%
Luminosity	0.5%
Rad.corr.	1.0%
Track overlap	0.6%
Background sub.	0.5%
	<b>2.9%</b>

**BaBar**

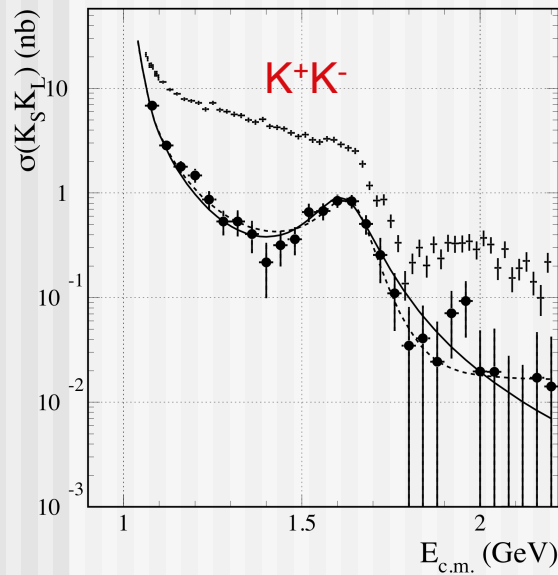

$$\begin{aligned} \Gamma_{ee} \cdot B_{K_S K_L} &= 0.4200 \pm 0.0033 \pm 0.0122 \pm 0.0019 \text{ keV} \\ \Gamma_{ee} &= 1.228 \pm 0.037 \pm 0.014_{(\text{PDG } B_{K_S K_L})} \text{ keV} \\ B_{ee} \cdot B_{K_S K_L} &= 0.986 \pm 0.030 \pm 0.009_{(\text{PDG } \Gamma_{K_S K_L})} \end{aligned}$$

# $e^+e^- \rightarrow K_S K_L$ cross section for $m(K_S K_L) > 1.06$ GeV

Systematic error  $\sim 10\%$  ( $\sim 30\%$  for  $\sigma < 0.3$  nb),  
dominated by background subtraction procedure.

# Is it $\phi(1680)$ ? Fit with single BW

$$\sigma(s) = \frac{P(s)}{s^{5/2}} \left| \frac{A_{\phi(1020)}}{\sqrt{P(m_\phi)}} + \frac{A_X}{\sqrt{P(m_X)}} \cdot e^{i\varphi} + A_{bkg} \right|^2$$

$$P(s) = \left( (s/2)^2 - m_{K^0}^2 \right)^{3/2}$$

$$A(s) = \frac{\Gamma(m^2) \cdot m^3 \sqrt{\sigma_0 \cdot m}}{s - m^2 + i\sqrt{s}\Gamma(s)}$$

$$\Gamma(s) = \Gamma \cdot \sum_f B_f \cdot \frac{P_f(s)}{P_f(m_f^2)}$$

$$A_{\phi(1020)} = A_\phi + A_\omega - A_\rho, \quad f = K^* K, \phi\eta, \phi\pi\pi, K_S K_L$$

$$\sigma_0 = 0.46 \pm 0.10 \pm 0.04 \text{ nb}$$

$$m = 1674 \pm 12 \pm 6 \text{ MeV}/c^2$$

$$\Gamma_0 = 165 \pm 38 \pm 70 \text{ MeV}$$

$$\varphi = 3.01 \pm 0.38 - \text{fixed to } \pi$$

$$\sigma_{bkg} = 0.36 \pm 0.18 \text{ nb}$$

$$\Gamma_{ee} \cdot B_{K_S K_L} = 14.3 \pm 2.4 \pm 1.5 \pm 6.0 \text{ eV}$$

Simultaneous  $K_S K_L$  and  $K^+ K^-$  (and  $\pi\pi$ ) fit is needed to separate  $I=0,1$  states and  $\omega(1420, 1650)$ ,  $\rho(1450, 1700)$  contribution

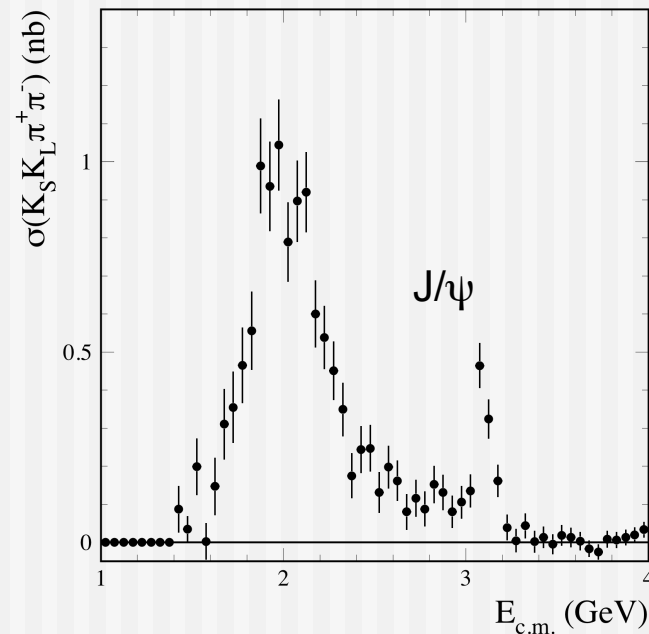

# $K_S K_L \pi^+ \pi^- \gamma$ event selection

- Select (best)  $K_S$
- Select ISR photon with  $E > 3$  GeV
- Two additional tracks from IP (no kaon ID)
- Cycle over remaining clusters with  $E > 0.2$  GeV –  $K_L$  candidates
- Best  $\chi^2$  for 3C fit ( $K_L$  momentum float)
- $\chi^2 > 100$  and  $|\text{Im}_{\gamma\gamma L} - 0.135| > 0.03$  for the  $K_S K \pi \pi^0 \gamma$  hypothesis

1580 events after  
background subtraction

No other  
measurements exist

# Some mass distributions in $K_S K_L \pi^+ \pi^- \gamma$

Very clear  $K^*(892)^\pm$  signals with  
 $1322 \pm 70$  for  $K^{*\pm}(K_S \pi)$  and  $1362 \pm 78$  for  $K^{*\pm}(K_L \pi)$   
 Plus  $183 \pm 48$  events for  $K_2(1430)^\pm$

How large is  $K^*(892)^+ K^*(892)^-$  ?  
 Fit slice in  $m(K_L \pi^+)$  for number of  $K_S \pi^+$

Very clear signal with  $913 \pm 37$  events (70%)  
 of  $K^*(892)^+ K^*(892)^-$  correlated production!  
 And  $90 \pm 16$  for  $K^*(892)^+ K_2(1430)^+$  .

We have negligible contribution from  $K^*(892)^0 \bar{K}^*(892)^0$   
 from our  $K^+ K^- \pi^+ \pi^-$  analysis!

# $\phi(1020)\pi^+\pi^-$ contribution in $K_S K_L \pi^+\pi^- \gamma$

$\phi\pi^+\pi^-$  ( $\phi f_0(980)$ )  
 seen as expected in  
 agreement with our  
 $K^+K^-\pi^+\pi^-$  study

# $K_S K_S \pi^+ \pi^- (K^+ K^-) \gamma$ event selection

- Select 2 (best)  $K_S$
- Select ISR photon with  $E > 3$  GeV
- Two additional tracks from IP with pion or kaon ID
- Best  $\chi^2$  for 4C fit assuming  $K_S K_S \pi^+ \pi^- (K^+ K^-) \gamma$  hypotheses

Simulation  
of  $\phi \gamma \rightarrow K_S K_L \gamma$   
compare to data

About 3000 ISR events with 2 good  $K_S$

Six tracks with ISR photon – very low background!

# $e^+e^- \rightarrow K_S K_S \pi^+ \pi^- (K^+ K^-)$ cross sections

No other measurements exist

# Some mass distributions in $K_S K_S \pi^+ \pi^-$

Very clear  $K^*(892)^\pm$  signals with  
 $829 \pm 49$  for  $K^{*+}(K_S \pi^+)$  and  $856 \pm 50$  for  $K^{*-}(K_S \pi^-)$   
 Plus  $116 \pm 40$  ( $70 \pm 34$ ) events for  $K_2^*(1430)^\pm$

How large is  $K^*(892)^+ K^*(892)^-$  ?  
 Fit slice in  $m(K_S \pi^-)$  for number of  $K_S \pi^+$

Very clear signal with  $742 \pm 30 \pm 100$  events (50%)  
 of  $K^*(892)^+ K^*(892)^-$  correlated production!

No  $K^*(892)^+ K_2^*(1430)^-$  seen.

# Some mass distributions in $K_S K_S \pi^+ \pi^-$

If we exclude  $K^*(892)^+ K^*(892)^-$  by  $|m(K_S \pi) - m(K^*)| < 0.15 \text{ GeV}/c^2$  in both combinations:

Plus some number of  $K^*(892) K_S \pi$  events

# Some mass distributions in $K_S K_S K^+ K^-$

$N(K^+ K^- f_2') = 29 \pm 7$  events

$m(K_S K_S) = 1.526 \pm 0.007$  GeV/c<sup>2</sup>

$\Gamma = 0.037 \pm 0.013$  GeV

PDG:

$m(f_2') = 1.525 \pm 0.005$  GeV/c<sup>2</sup>

$\Gamma = 0.073 \pm 0.006$  GeV

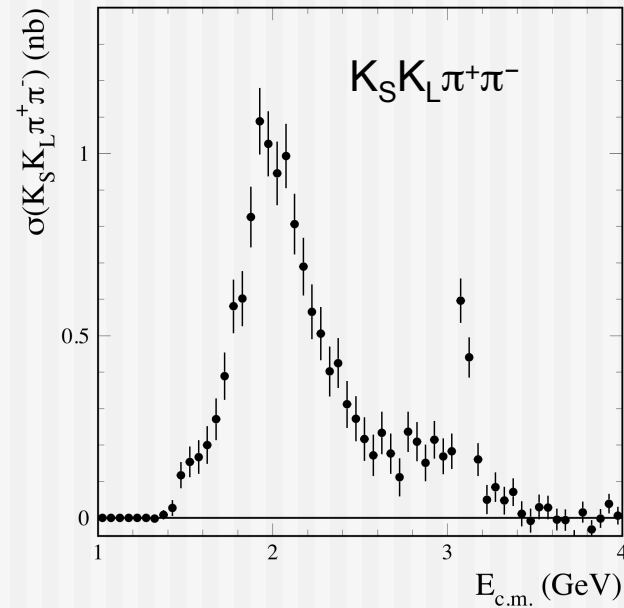

# $K_S K_L \pi^+ \pi^-$ , $K_S K_S \pi^+ \pi^-$ signal decomposition

# The cross section comparison – BaBar data

# Iso-spin relations for $K^+K^-\pi^+\pi^+$ vs. $K^+K^-\pi^0\pi^0$ vs. $K_S K_L \pi^+\pi^-$ vs. $K_S K_S \pi^+\pi^-$

Only  $K^*(892)^+K^*(892)^-$  contribution can be compared using iso-spin relations, and we expect:

$$\begin{aligned} N(K^+K^-\pi^0\pi^0) &= \frac{1}{4} N(K^0\bar{K}^0 \pi^+\pi^-) \\ N(K_S K_L \pi^+\pi^-) &= \frac{1}{2} N(K^0\bar{K}^0 \pi^+\pi^-) \\ N(K_S K_S \pi^+\pi^-) &= N(K_L K_L \pi^+\pi^-) = \frac{1}{4} N(K^0\bar{K}^0 \pi^+\pi^-) \end{aligned}$$

We detect number of correlated pairs:

$$N(K^+K^-\pi^0\pi^0) = 1750 \pm 60 \quad \text{eff} = 8\%$$

$$N(K_S K_L \pi^+\pi^-) = 2098 \pm 209 \quad \text{eff} = 5\%$$

$$N(K_S K_S \pi^+\pi^-) = 742 \pm 104 \quad \text{eff} = 4.5\%$$

Should be equal numbers after efficiency normalized to 5% and iso-spin correction:

$2188 \pm 76$	~	$2098 \pm 209$	~	$1648 \pm 232$
---------------	---	----------------	---	----------------

Some tension (~2 sigma)

30%

63%

50%

of all events – how the rest are added to the g-2 calculation?

# $K_S K^- \pi^+ \pi^- \pi^0 \gamma$ , $K_S K^- \pi^+ \pi^- \eta \gamma$ event selection

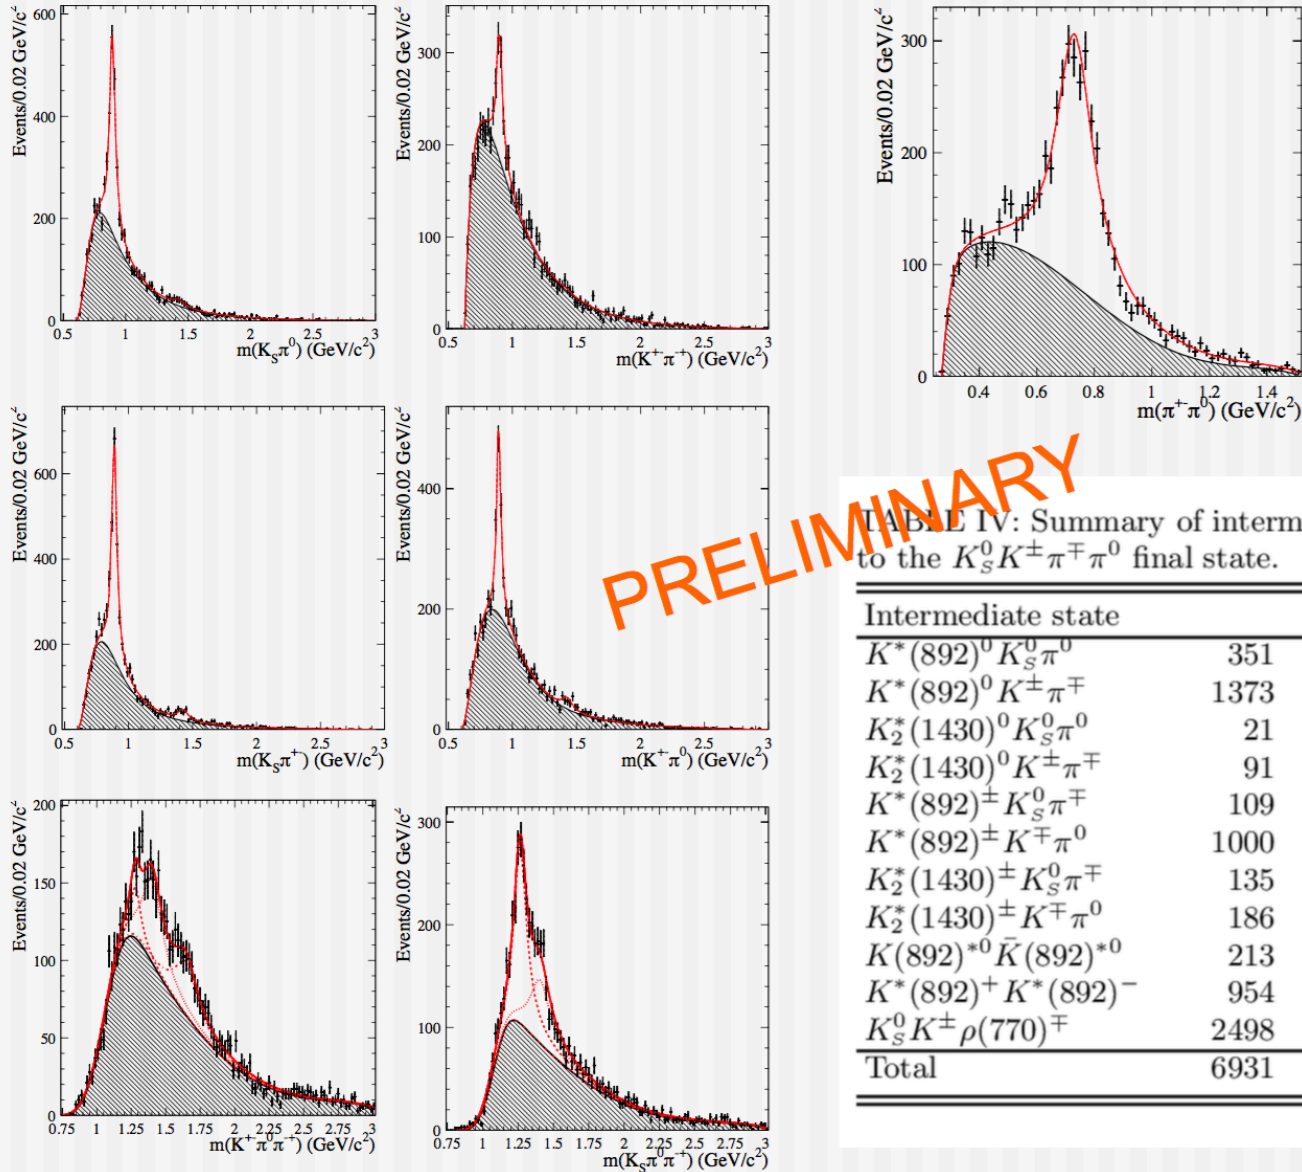

- Select 1 (best)  $K_S$
- Select ISR photon with  $E > 3$  GeV
- Two additional tracks from IP with pion or kaon ID
- Loop over remaining photons in  $\pi^0$  or  $\eta$  mass windows
- Best  $\chi^2$  for 5C fit assuming  $K_S K^- \pi^+ \pi^- \pi^0(\eta) \gamma$  hypotheses

PRELIMINARY

No other measurements exist

# Many intermediate states

PRELIMINARY

TABLE IV: Summary of intermediate processes contributing to the  $K_S^0 K^\pm \pi^\mp \pi^0$  final state.

Intermediate state	Number of events

 $B(J/\psi \rightarrow \phi f_2') = (1.23 \pm 0.026 \pm 0.20) \cdot 10^{-3}$  (DM2)

We measure:

$$B_{J/\psi \rightarrow f} \cdot \Gamma_{ee}^{J/\psi} = \frac{N_{J/\psi \rightarrow f} \cdot m_{J/\psi}^2}{6\pi^2 \cdot d\mathcal{L}/dE \cdot \epsilon_f(m_{J/\psi}) \cdot C}$$

# Summary

- BaBar continues analysis of collected data and ISR studies in particular
- Most published results for  $e^+e^- \rightarrow \text{hadrons}$  reactions have the best to date accuracy.
- Recently obtained  $e^+e^- \rightarrow K_S K_L \pi^+ \pi^-$ ,  $K_S K_S \pi^+ \pi^-$ ,  $K_S K_S K^+ K^-$ ,  $K_S K^- \pi^+ \pi^0(\eta)$  cross sections were never studied before. Intermediate states study is performed.
- Using these cross sections we can reduce uncertainty in the muon g-2 calculation.
- $J/\psi$  decays to above modes have been measured for the first time.
- Results for  $K_S K_L \pi^0(\pi^0)$  final state should come out soon – it will completely close iso-spin relations problem in the g-2 calculation for the  $KK\pi\pi$  modes.

# BaBar measured: $e^+e^- \rightarrow \pi^+\pi^-$

Published **Phys. Rev. D 86, 032013 (2012)**

Our result is more precise than previous experiments

Motivation: dominance of the  $E < 1\text{GeV}$  region, accessed through  $\pi^+\pi^-$

Features of the cross section distribution

- Includes possible FSR
- Dominated by  $\rho(770)$  resonance
- $\rho$ - $\omega$  interference
- Dip at 1.6GeV: interference between  $\rho'$  and  $\rho''$
- Dip at 2.2GeV: higher mass  $\rho$  state

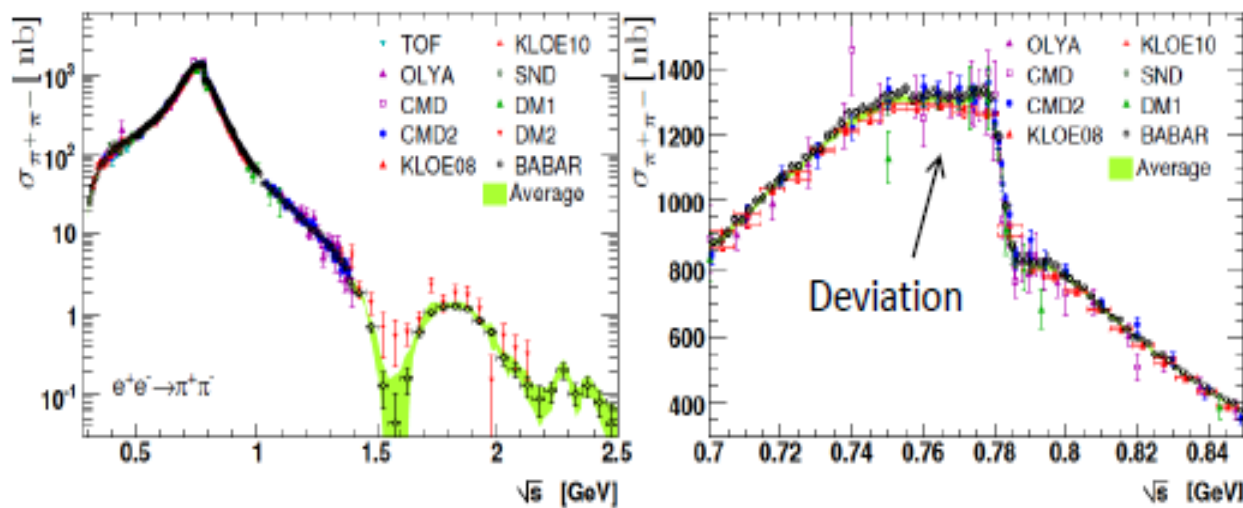

LO Hadr., 0.28-1.8 GeV

Babar

$$a_\mu = (514.1 \pm 3.8) \cdot 10^{-10}$$

all  $e^+e^-$

$$a_\mu = (505.8 \pm 3.0) \cdot 10^{-10}$$

# BaBar measured: $e^+e^- \rightarrow K^+K^-$

Published **Phys. Rev. D 88, 032013 (2013)**

Our result is more precise than the current world average

Based on  $232 \text{ fb}^{-1}$  dataset

# BaBar updated: $e^+e^- \rightarrow \pi^+\pi^-\pi^+\pi^-$

Published PRD 85 112009 (2012)

Based on 454 fb<sup>-1</sup> dataset (statistical uncertainties are shown)

Our result is more precise than the current world average (<3% systematic error)

# SM prediction for muon g-2

<sup>a</sup> $\mathcal{B}_{J/\psi \rightarrow \phi \bar{K}K}$  obtained as  $2 \cdot \mathcal{B}_{J/\psi \rightarrow \phi K^+K^-}$ .

<sup>b</sup>Not corrected for the  $f_0 \rightarrow \pi^0\pi^0$  mode.

<sup>c</sup>Not corrected for the  $f_0 \rightarrow \pi^+\pi^-$  mode.

<sup>d</sup>We compare our  $\phi f_x$ ,  $f_x \rightarrow \pi^+\pi^-$  mode with  $\phi f_2(1270)$ .

<sup>e</sup> $\mathcal{B}_{\psi(2S) \rightarrow \phi f_0}$ ,  $f_0 \rightarrow \pi^+\pi^-$

Small systematic errors allow BaBar to improve BF for major decay modes.

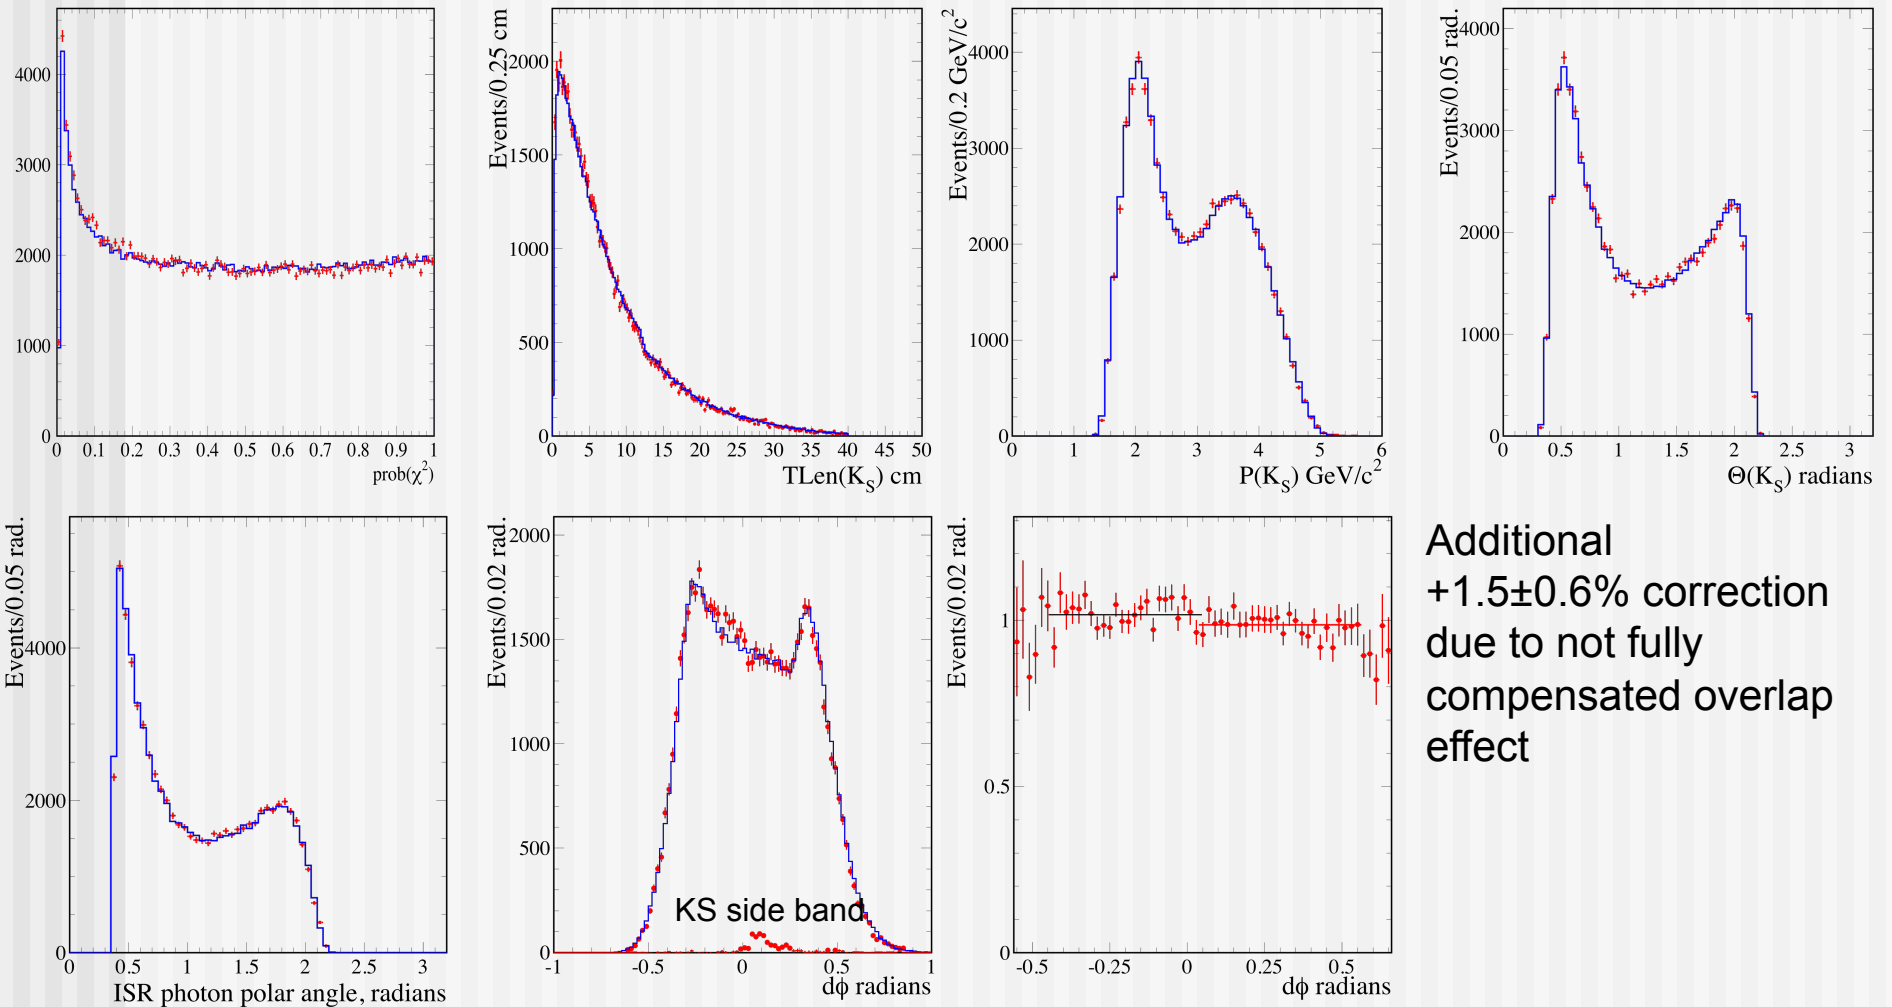

# $\phi(1020)$ mass

In MC we know all inputs and can create a “test”  $m(K_L)$  distribution and compare with data. And the only free parameter is  $\phi(1020)$  mass. By varying  $\phi$  mass we calculate  $\chi^2$  value by fitting data-MC difference with “ARGUS” function. We obtain:

$m_\phi = 1019.483 \pm 0.040 \pm 0.036 \text{ MeV}/c^2$  : 24 keV –  $K^0$  mass uncertainty, 20 keV –  $K_S$  momentum, 18 keV – DCH-EMC mis-alignment.

# How other distributions look like

Additional  
 $+1.5 \pm 0.6\%$  correction  
 due to not fully  
 compensated overlap  
 effect

Clean events with small systematic errors - 1% from KS, 0.5% ISR photon, 0.5% background, 0.6% from overlap effect.

# What we know about $\phi(1680)$

Energy dependence significantly increase width.

BaBar has measured  $\phi(1680)$  parameters in major decay modes:

$\phi(1680) \rightarrow K_S K \pi, KK\pi^0 (K^* K), \phi \eta, \phi \pi \pi, K_S K_L$  - still no info in PDG
