- ▶ **Acknowledgments**

- ▶ Main interest in creating high-quality secondary K_L^0 beam is to investigate hyperon spectroscopy.
- ▶ Here we review what can be learned by studying $K_L^0 p$ scattering going to two-body final states.
- ▶ Mean lifetime of the K^- is 12.38 ns ($c\tau = 3.7$ m) whereas mean lifetime of the K_L^0 is 51.16 ns ($c\tau = 15.3$ m). Thus, it is much easier to perform measurements of $K_L^0 p$ scattering at low beam energies than $K^- p$ scattering due to higher beam flux.

- ▶ Here, we summarize some of the physics issues involved with such processes.
- ▶ The differential cross section and polarization for $K_L^0 P$ scattering are given by

$$\frac{d\sigma}{d\Omega} = \lambda^2 (|f|^2 + |g|^2),$$

$$P \frac{d\sigma}{d\Omega} = 2\lambda^2 \text{Im}(fg^*),$$

where $\lambda = \hbar/k$, with k the magnitude of c.m. momentum for the incoming meson. Here $f = f(W, \theta)$ and $g = g(W, \theta)$ are the usual spin-nonflip and spin-flip amplitudes at c.m. energy W and meson c.m. scattering angle θ .

Partial-Wave Expansion

- ▶ In terms of partial waves, f and g can be expanded as

$$f(W, \theta) = \sum_{l=0}^{\infty} [(l+1)T_{l+} + lT_{l-}]P_l(\cos \theta),$$

$$g(W, \theta) = \sum_{l=1}^{\infty} [T_{l+} - T_{l-}]P_l^1(\cos \theta).$$

- ▶ Here l is the initial orbital angular momentum, $P_l(\cos \theta)$ is a Legendre polynomial, and $P_l^1(\cos \theta) = \sin \theta \times dP_l(\cos \theta)/d(\cos \theta)$ is an associated Legendre function.
- ▶ The total angular momentum for T_{l+} is $J = l + \frac{1}{2}$, while that for T_{l-} is $J = l - \frac{1}{2}$.

Isospin Amplitudes

- ▶ We may ignore small CP-violating terms and write

$$K_L^0 = \frac{1}{\sqrt{2}}(K^0 - \bar{K}^0),$$

$$K_S^0 = \frac{1}{\sqrt{2}}(K^0 + \bar{K}^0).$$

- ▶ We have both $I = 0$ and $I = 1$ amplitudes for KN and $\bar{K}N$ scattering, so that amplitudes $T_{l\pm}$ can be expanded in isospin amplitudes as

$$T_{l\pm} = C_0 T_{l\pm}^0 + C_1 T_{l\pm}^1,$$

where $T_{l\pm}^I$ are partial-wave amplitudes with isospin I and total angular momentum $J = l \pm \frac{1}{2}$, with C_I the appropriate isospin Clebsch-Gordon coefficients.

KN and $\bar{K}N$ Final States

D. Mark Manley

Introduction

PWA Formalism

KN and $\bar{K}N$ Final
States

$\pi\Lambda$ Final States

$\pi\Sigma$ Final States

$K\Xi$ Final States

Summary

Acknowledgments

$$T(K^- p \rightarrow K^- p) = \frac{1}{2}T^1(\bar{K}N \rightarrow \bar{K}N) + \frac{1}{2}T^0(\bar{K}N \rightarrow \bar{K}N)$$

$$T(K^- p \rightarrow \bar{K}^0 n) = \frac{1}{2}T^1(\bar{K}N \rightarrow \bar{K}N) - \frac{1}{2}T^0(\bar{K}N \rightarrow \bar{K}N)$$

$$T(K^+ p \rightarrow K^+ p) = T^1(KN \rightarrow KN)$$

$$T(K^+ n \rightarrow K^+ n) = \frac{1}{2}T^1(KN \rightarrow KN) + \frac{1}{2}T^0(KN \rightarrow KN)$$

KN and $\bar{K}N$ Final States (cont'd)

$$T(K_L^0 p \rightarrow K_S^0 p) = \frac{1}{2} \left(\frac{1}{2} T^1(KN \rightarrow KN) + \frac{1}{2} T^0(KN \rightarrow KN) \right) - \frac{1}{2} T^1(\bar{K}N \rightarrow \bar{K}N)$$

$$T(K_L^0 p \rightarrow K_L^0 p) = \frac{1}{2} \left(\frac{1}{2} T^1(KN \rightarrow KN) + \frac{1}{2} T^0(KN \rightarrow KN) \right) + \frac{1}{2} T^1(\bar{K}N \rightarrow \bar{K}N)$$

$$T(K_L^0 p \rightarrow K^+ n) = \frac{1}{\sqrt{2}} \left(\frac{1}{2} T^1(KN \rightarrow KN) - \frac{1}{2} T^0(KN \rightarrow KN) \right) - \frac{1}{2} T^1(\bar{K}N \rightarrow \bar{K}N)$$

Data for $K_L^0 p \rightarrow K_S^0 p$ and $K_L^0 p \rightarrow K^+ n$

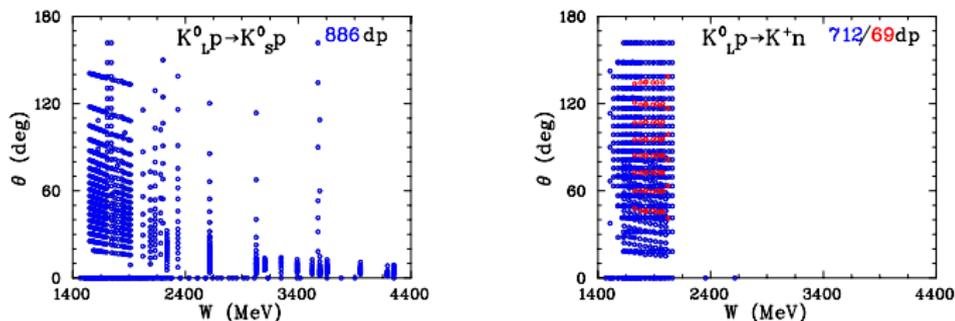

Figure: Distribution of measured data for $K_L^0 p \rightarrow K_S^0 p$ and $K_L^0 p \rightarrow K^+ n$. $d\sigma/d\Omega$ data are shown as blue open circles and polarization data are shown as red open circles. σ data are shown on the $\theta = 0$ line.

- ▶ No $d\sigma/d\Omega$ data are available for $K_L^0 p \rightarrow K_L^0 p$ below $W \sim 2948$ MeV.
- ▶ A fair amount of data are available for the reaction, $K^+ n \rightarrow K^0 p$, measured on a deuterium target.
- ▶ Next two slides show a sample of available data for $K_L^0 p \rightarrow K_S^0 p$ compared with predictions determined from our previous PWA of $\bar{K}N \rightarrow \bar{K}N$ data, combined with $KN \rightarrow KN$ amplitudes from SAID solution. The predictions at lower and higher energies tend to agree less well with the data.

$d\sigma/d\Omega$ Data for $K_L^0 p \rightarrow K_S^0 p$

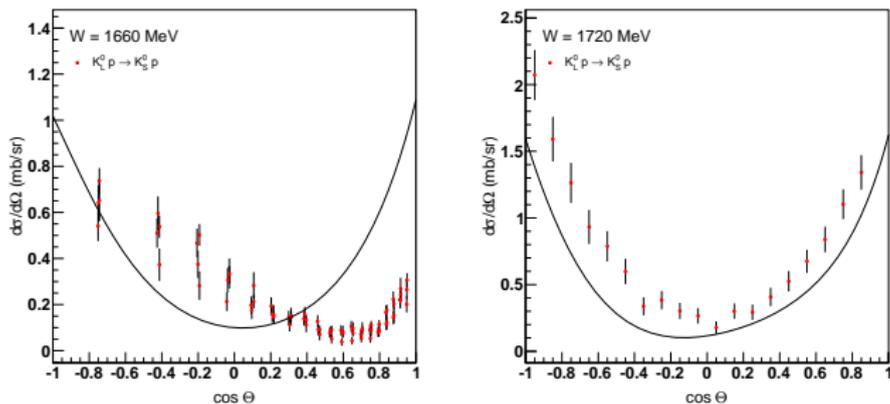

Figure: Selected data for $K_L^0 p \rightarrow K_S^0 p$ at 1660 MeV and 1720 MeV. The curves are predictions using amplitudes from our previous PWA of $\bar{K}N \rightarrow \bar{K}N$ combined with $KN \rightarrow KN$ amplitudes from SAID solution.

$d\sigma/d\Omega$ Data for $K_L^0 p \rightarrow K_S^0 p$

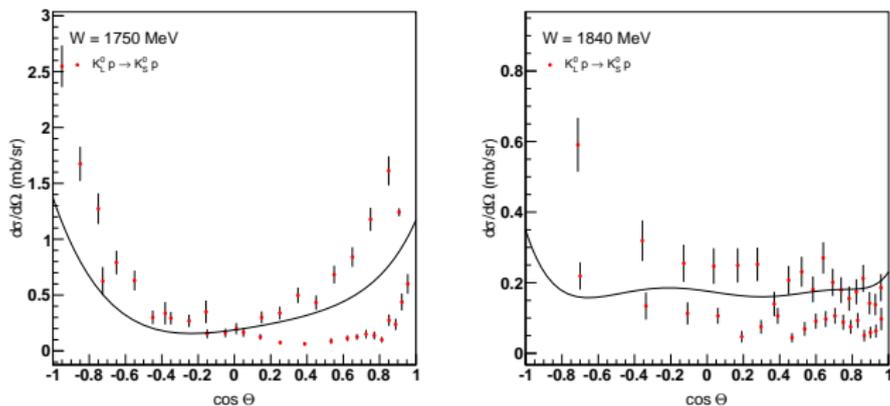

Figure: Selected data for $K_L^0 p \rightarrow K_S^0 p$ at 1750 MeV and 1840 MeV. The curves are predictions using amplitudes from our previous PWA of $\bar{K}N \rightarrow \bar{K}N$ combined with $KN \rightarrow KN$ amplitudes from SAID solution.

KN and $\bar{K}N$ Final
States

$\pi\Lambda$ Final States

$\pi\Sigma$ Final States

$K\Xi$ Final States

Summary

Acknowledgments

$$T(K^- p \rightarrow \pi^0 \Lambda) = \frac{1}{\sqrt{2}} T^1(\bar{K}N \rightarrow \pi\Lambda)$$
$$T(K_L^0 p \rightarrow \pi^+ \Lambda) = -\frac{1}{\sqrt{2}} T^1(\bar{K}N \rightarrow \pi\Lambda)$$

Data for $K_L^0 p \rightarrow \pi^+ \Lambda$

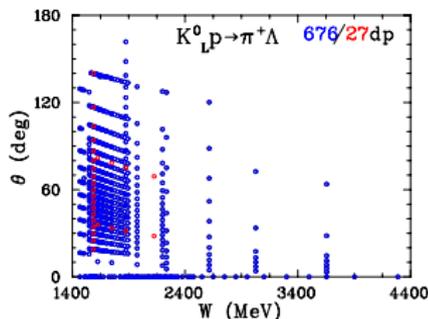

Figure: Distribution of measured data for $K_L^0 p \rightarrow \pi^+ \Lambda$. $d\sigma/d\Omega$ data are shown as blue open circles and polarization data are shown as red open circles. σ data are shown on the $\theta = 0$ line.

- ▶ $K^- p \rightarrow \pi^0 \Lambda$ and $K_L^0 p \rightarrow \pi^+ \Lambda$ amplitudes imply that their observables measured at same energy should be identical except for small differences due to isospin-violating mass differences in the hadrons.
- ▶ No $d\sigma/d\Omega$ data for $K^- p \rightarrow \pi^0 \Lambda$ are available at c.m. energies $W < 1540$ MeV, although data for $K_L^0 p \rightarrow \pi^+ \Lambda$ are available at such energies (next slide).
- ▶ At 1540 MeV and higher, $d\sigma/d\Omega$ and polarization data for the two reactions are in fair agreement, as shown in the following slides.

Low-energy $d\sigma/d\Omega$ Data for $K_L^0 p \rightarrow \pi^+ \Lambda$

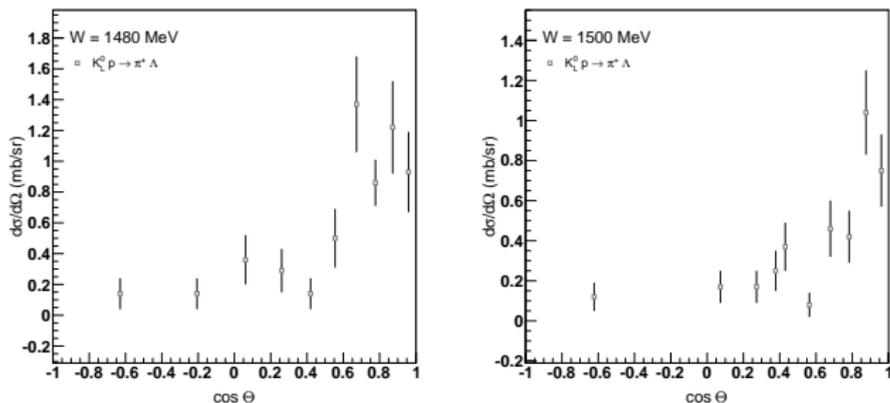

Figure: Data for $K_L^0 p \rightarrow \pi^+ \Lambda$ at 1480 MeV and 1500 MeV. No data for $K^- p \rightarrow \pi^0 \Lambda$ are available below 1540 MeV.

$d\sigma/d\Omega$ Data for $K^-p \rightarrow \pi^0\Lambda$ and $K_L^0p \rightarrow \pi^+\Lambda$

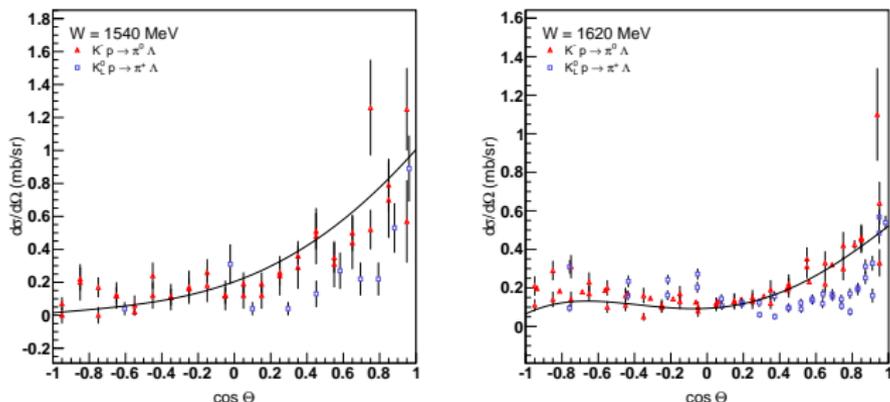

Figure: Comparison of selected $d\sigma/d\Omega$ data for $K^-p \rightarrow \pi^0\Lambda$ (red) and $K_L^0p \rightarrow \pi^+\Lambda$ (blue) at 1540 MeV and 1620 MeV. The curves are from our previous PWA of $K^-p \rightarrow \pi^0\Lambda$ data.

$d\sigma/d\Omega$ Data for $K^-p \rightarrow \pi^0\Lambda$ and $K_L^0p \rightarrow \pi^+\Lambda$

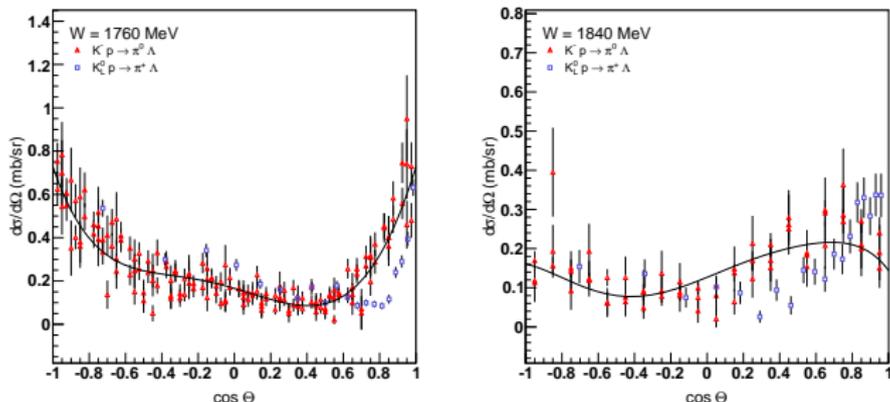

Figure: Comparison of selected $d\sigma/d\Omega$ data for $K^-p \rightarrow \pi^0\Lambda$ (red) and $K_L^0p \rightarrow \pi^+\Lambda$ (blue) at 1760 MeV and 1840 MeV. The curves are from our previous PWA of $K^-p \rightarrow \pi^0\Lambda$ data.

Polarization Data for $K^-p \rightarrow \pi^0\Lambda$ and $K_L^0p \rightarrow \pi^+\Lambda$

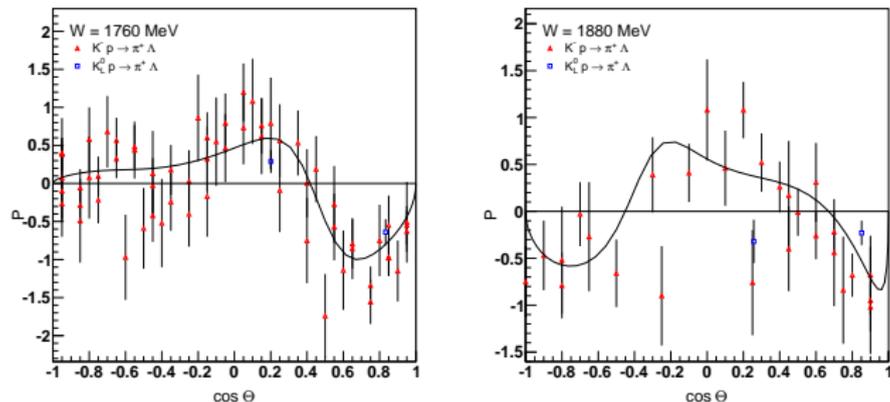

Figure: Comparison of selected polarization data for $K^-p \rightarrow \pi^0\Lambda$ (red) and $K_L^0p \rightarrow \pi^+\Lambda$ (blue) at 1760 MeV and 1880 MeV. The curves are from our previous PWA of $K^-p \rightarrow \pi^0\Lambda$ data.

$$T(K^- p \rightarrow \pi^- \Sigma^+) = -\frac{1}{2}T^1(\bar{K}N \rightarrow \pi\Sigma) - \frac{1}{\sqrt{6}}T^0(\bar{K}N \rightarrow \pi\Sigma)$$

$$T(K^- p \rightarrow \pi^+ \Sigma^-) = \frac{1}{2}T^1(\bar{K}N \rightarrow \pi\Sigma) - \frac{1}{\sqrt{6}}T^0(\bar{K}N \rightarrow \pi\Sigma)$$

$$T(K^- p \rightarrow \pi^0 \Sigma^0) = \frac{1}{\sqrt{6}}T^0(\bar{K}N \rightarrow \pi\Sigma)$$

$$T(K_L^0 p \rightarrow \pi^+ \Sigma^0) = -\frac{1}{2}T^1(\bar{K}N \rightarrow \pi\Sigma)$$

$$T(K_L^0 p \rightarrow \pi^0 \Sigma^+) = \frac{1}{2}T^1(\bar{K}N \rightarrow \pi\Sigma)$$

Data for $K_L^0 p \rightarrow \pi^0 \Sigma^+$ and $K_L^0 p \rightarrow \pi^+ \Sigma^0$

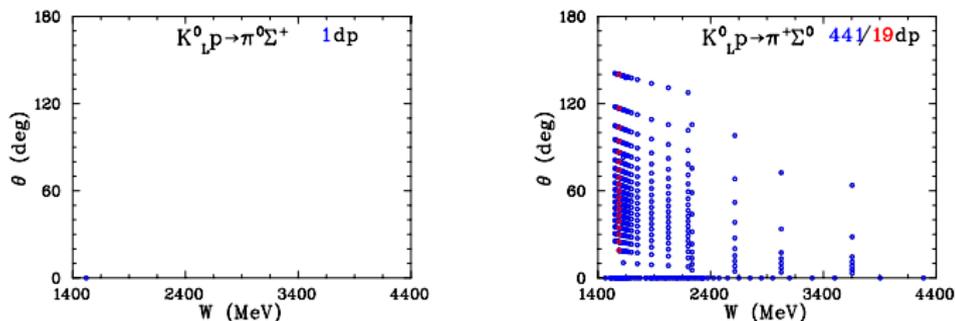

Figure: Distribution of measured data for $K_L^0 p \rightarrow \pi^0 \Sigma^+$ and $K_L^0 p \rightarrow \pi^+ \Sigma^0$. $d\sigma/d\Omega$ data are shown as blue open circles and polarization data are shown as red open circles. σ data are shown on the $\theta = 0$ line.

- ▶ Reactions $K_L^0 p \rightarrow \pi^+ \Sigma^0$ and $K_L^0 p \rightarrow \pi^0 \Sigma^+$ are **isospin selective** (only $I = 1$ amplitudes are involved) whereas reactions $K^- p \rightarrow \pi^- \Sigma^+$ and $K^- p \rightarrow \pi^+ \Sigma^-$ are not. **New measurements with a K_L^0 beam would lead to better understanding of Σ^* states and help constrain amplitudes for $K^- p \rightarrow \pi \Sigma$ reactions**
- ▶ **No $d\sigma/d\Omega$ data are available for $K_L^0 p \rightarrow \pi^0 \Sigma^+$**
- ▶ Next two slides compare $d\sigma/d\Omega$ data for $K^- p$ and $K_L^0 p$ reactions leading to $\pi \Sigma$ final states at $W = 1660$ MeV (or $P_{\text{lab}} = 716$ MeV/c)
- ▶ Quality of $K_L^0 p$ data is comparable to that for $K^- p$ data. **It would be advantageous to combine $K_L^0 p$ data in a new coupled-channel PWA with available $K^- p$ data**

$d\sigma/d\Omega$ Data for $K^-p \rightarrow \pi^- \Sigma^+$ and $K^-p \rightarrow \pi^+ \Sigma^-$

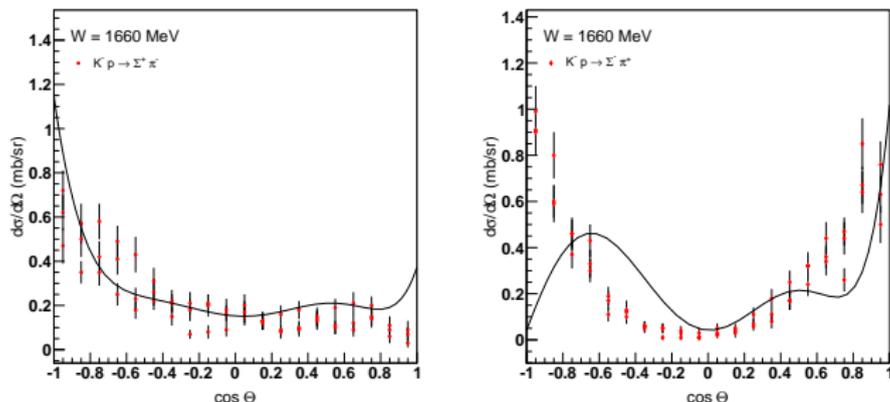

Figure: Comparison of selected $d\sigma/d\Omega$ data for $K^-p \rightarrow \pi^- \Sigma^+$ and $K^-p \rightarrow \pi^+ \Sigma^-$ at 1660 MeV. The curves are from our previous PWA of $K^-p \rightarrow \pi\Sigma$ data.

$d\sigma/d\Omega$ Data for $K^-p \rightarrow \pi^0\Sigma^0$ and $K_L^0p \rightarrow \pi^+\Sigma^0$

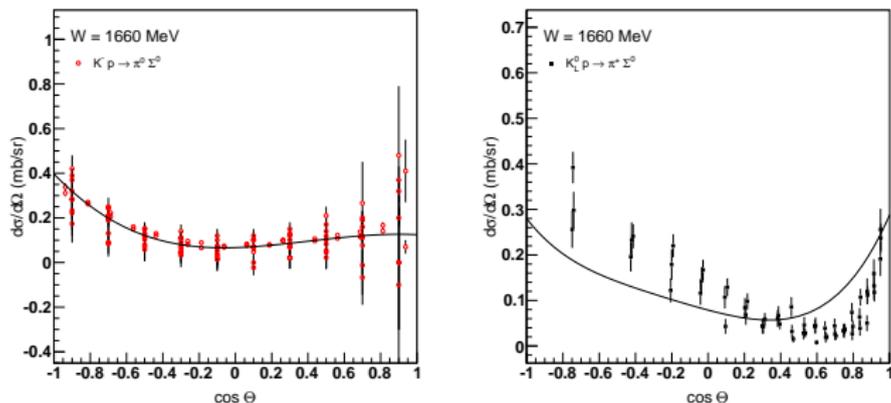

Figure: Comparison of selected $d\sigma/d\Omega$ data for $K^-p \rightarrow \pi^0\Sigma^0$ and $K_L^0p \rightarrow \pi^+\Sigma^0$ at 1660 MeV. The curves are from our previous PWA of $K^-p \rightarrow \pi\Sigma$ data.

$$T(K^- p \rightarrow K^0 \Xi^0) = \frac{1}{2} T^1(\bar{K}N \rightarrow K\Xi) + \frac{1}{2} T^0(\bar{K}N \rightarrow K\Xi)$$

$$T(K^- p \rightarrow K^+ \Xi^-) = \frac{1}{2} T^1(\bar{K}N \rightarrow K\Xi) - \frac{1}{2} T^0(\bar{K}N \rightarrow K\Xi)$$

$$T(K_L^0 p \rightarrow K^+ \Xi^0) = -\frac{1}{\sqrt{2}} T^1(\bar{K}N \rightarrow K\Xi)$$

- ▶ Threshold for K^-p and $K_L^0 p$ reactions leading to $K\Xi$ final states is fairly high ($W_{\text{thresh}} = 1816$ MeV)
- ▶ There are no $d\sigma/d\Omega$ data available for $K_L^0 p \rightarrow K^+\Xi^0$ and very few (none recent) for $K^-p \rightarrow K^0\Xi^0$ or $K^-p \rightarrow K^+\Xi^-$
- ▶ Measurements for these reactions would be very helpful, especially for comparing with predictions from dynamical coupled-channel (DCC) models
- ▶ $K_L^0 p \rightarrow K^+\Xi^0$ is isospin-1 selective, whereas the reactions $K^-p \rightarrow K^0\Xi^0$ and $K^-p \rightarrow K^+\Xi^-$ involve both $I = 0$ and $I = 1$ amplitudes
- ▶ The *Review of Particle Physics* lists only two states with branching fractions (BF) to $K\Xi$, namely, $\Lambda(2100)\frac{7}{2}^-$ (BF < 3%) and $\Sigma(2030)\frac{7}{2}^+$ (BF < 2%)

Summary

- ▶ New data for $K_L^0 p$ scattering could significantly improve our knowledge of Λ^* and Σ^* Resonances
- ▶ Very few polarization data are available for any $K_L^0 p$ reactions
- ▶ Several $K_L^0 p$ reactions are isospin selective, so would help constrain PWAs of $K^- p$ scattering
- ▶ Long lifetime of K_L^0 would allow measurements to be made at lower energies than can be done easily with K^- beams
