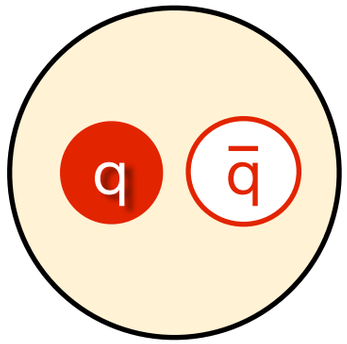
The GlueX Meson Program

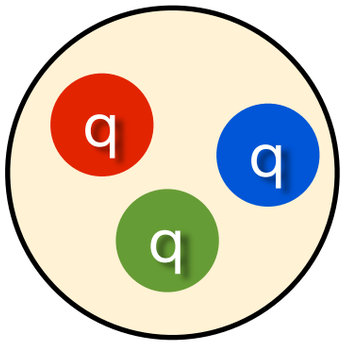
Justin Stevens

William & Mary
CHARTERED 1693

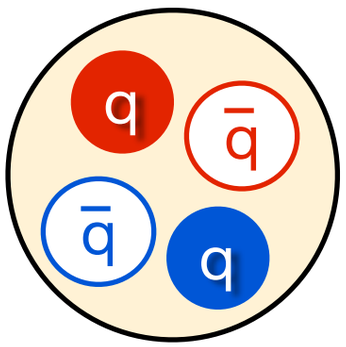
Confined states of quarks and gluons



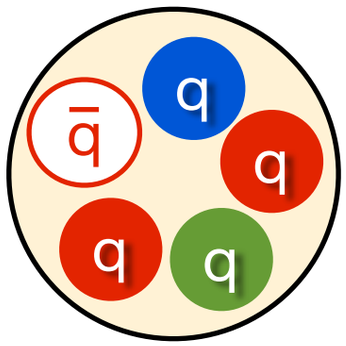
mesons



baryons



tetraquark



pentaquark

Observed mesons and baryons well described by 1st principles QCD

But these aren't the only states permitted by QCD

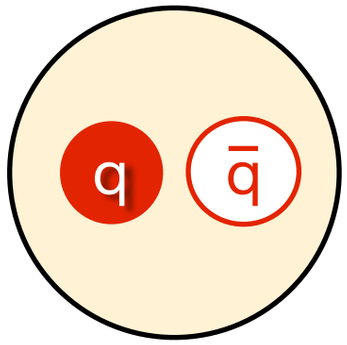
A SCHEMATIC MODEL OF BARYONS AND MESONS *

M. GELL-MANN
California Institute of Technology, Pasadena, California

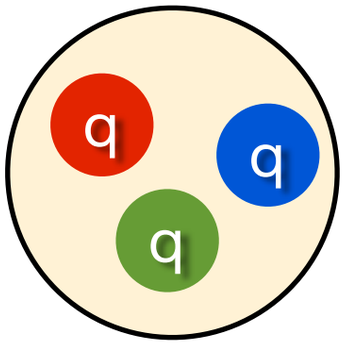
... Baryons can now be constructed from quarks by using the combinations $(q\,q\,q)$, $(q\,q\,q\,q\,\bar{q})$, etc., while mesons are made out of $(q\,\bar{q})$, $(q\,q\,\bar{q}\,\bar{q})$, etc. ...

Phys. Lett. 8 (1964) 214

Confined states of quarks and gluons



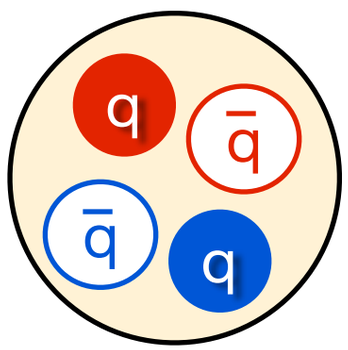
mesons



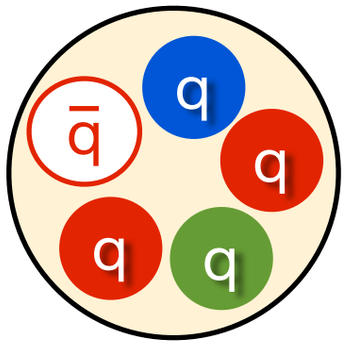
baryons

Observed mesons and baryons well described by 1st principles QCD

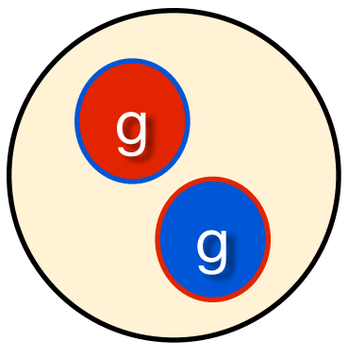
But these aren't the only states permitted by QCD



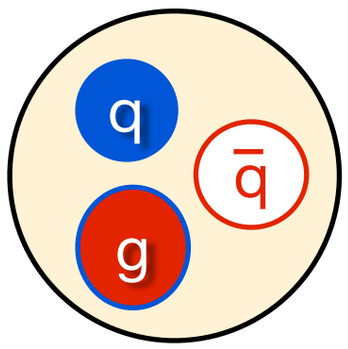
tetraquark



pentaquark



glueball



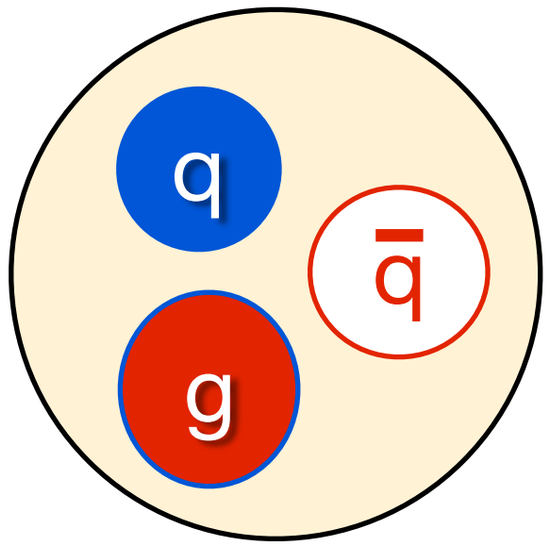
hybrid meson

Do gluonic degrees of freedom manifest themselves in the bound states we observe in nature?

Hybrid mesons and gluonic excitations

- Excited gluonic field coupled to $q\bar{q}$ pair
- Rich spectrum of hybrid mesons predicted by Lattice QCD
- Gluonic field with $J^{PC} = 1^{+-}$ and mass = 1-1.5 GeV
- "Exotic" J^{PC} : not simple $q\bar{q}$ from the non-rel. quark model

$$J^{PC} = 0^{+-}, 1^{-+}, 2^{+-} ...$$

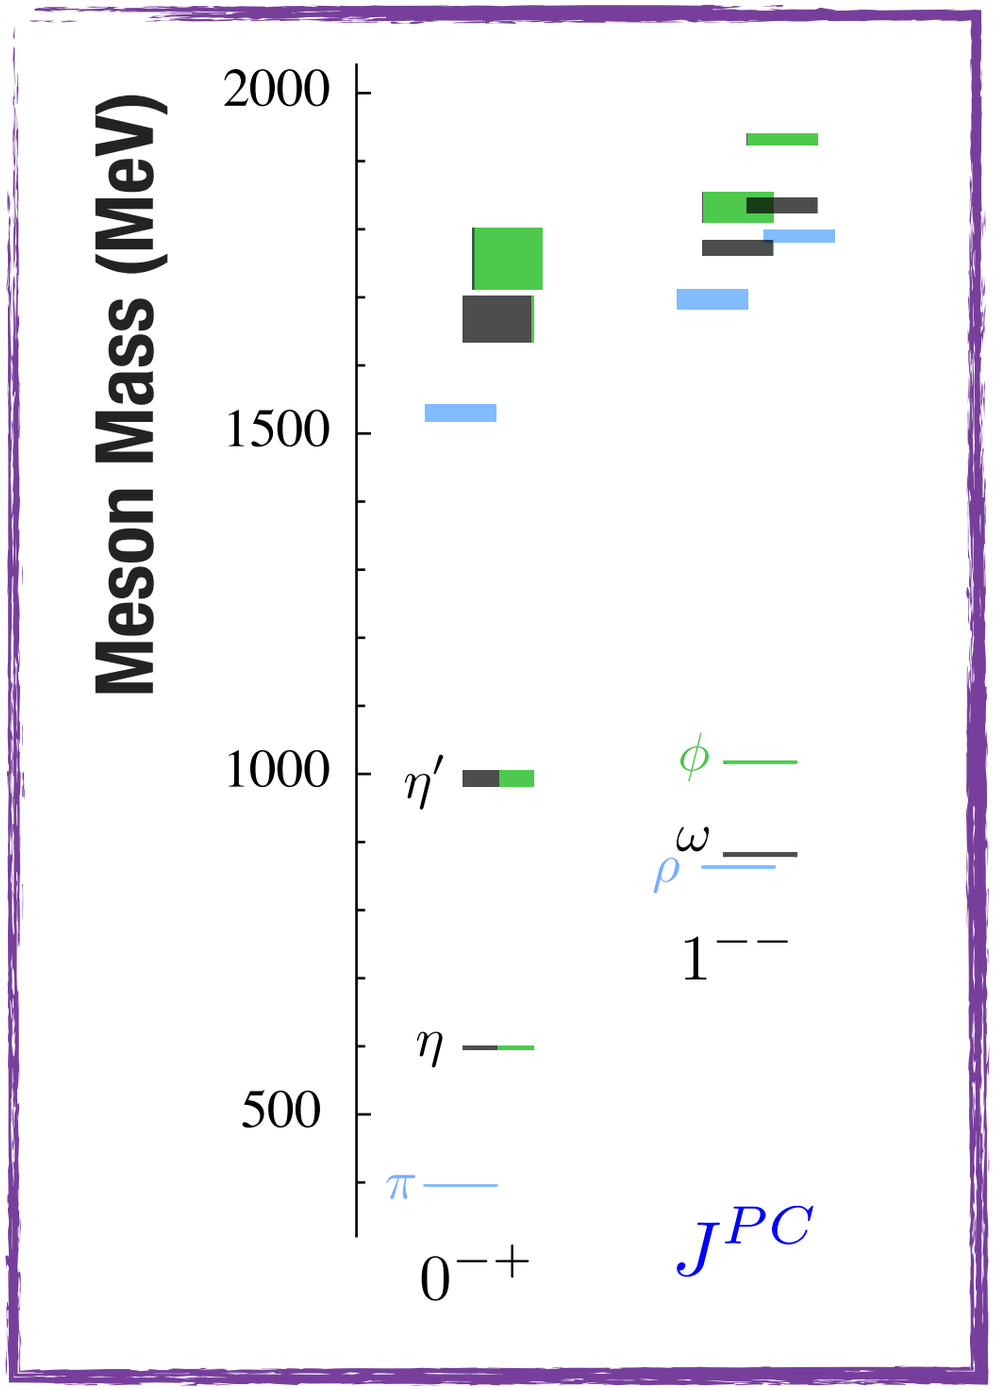


hybrid meson

$$\vec{J} = \vec{L} + \vec{S}$$
$$P = (-1)^{L+1}$$
$$C = (-1)^{L+S}$$

Lattice QCD

Dudek et al. PRD 88 (2013) 094505



$u\bar{u} + d\bar{d}$

$s\bar{s}$

$\phi = |s\bar{s}\rangle$

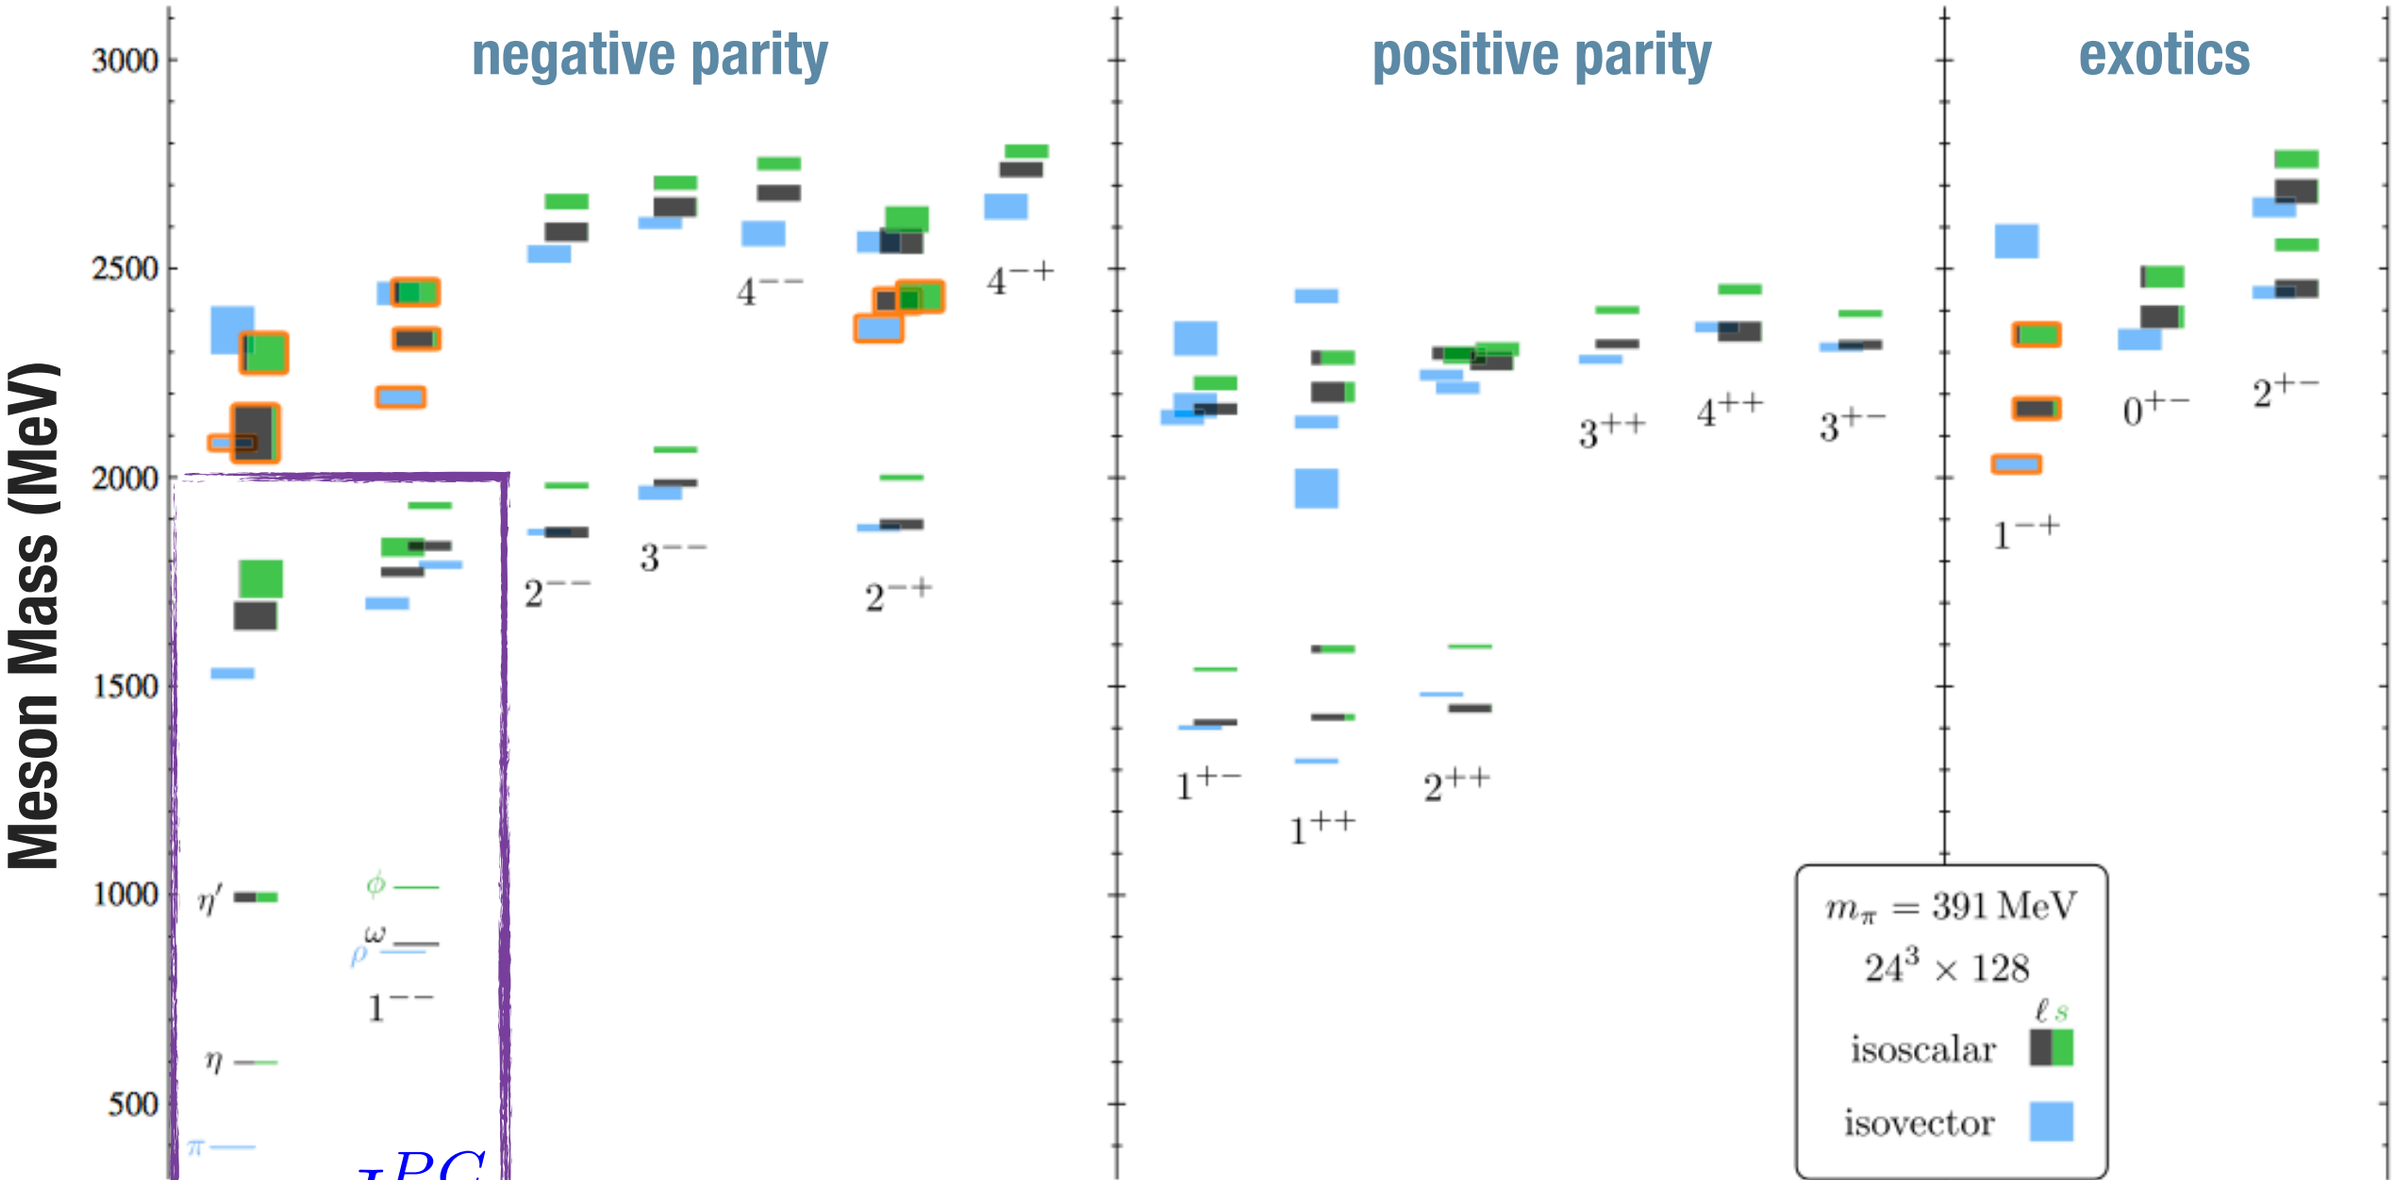
$\omega = |u\bar{u} + d\bar{d}\rangle$

$\pi^0 = |u\bar{u} - d\bar{d}\rangle$

Note: $m_\pi = 392\,\mathrm{MeV}$

Lattice QCD

Dudek et al. PRD 88 (2013) 094505



Lattice QCD

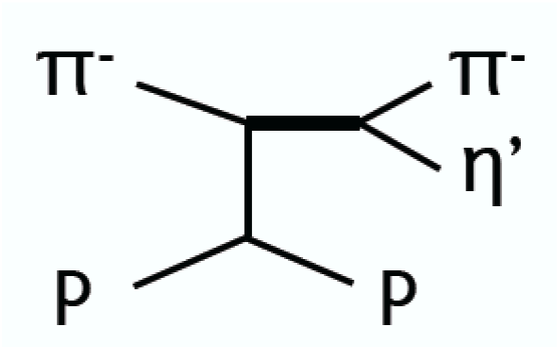
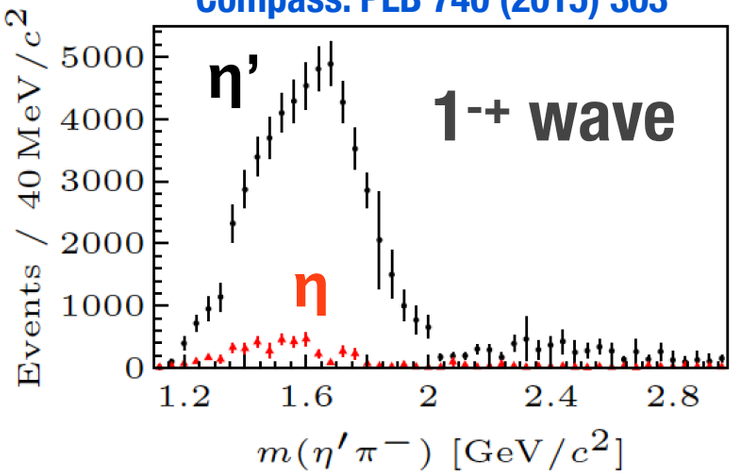
Lightest hybrid mesons



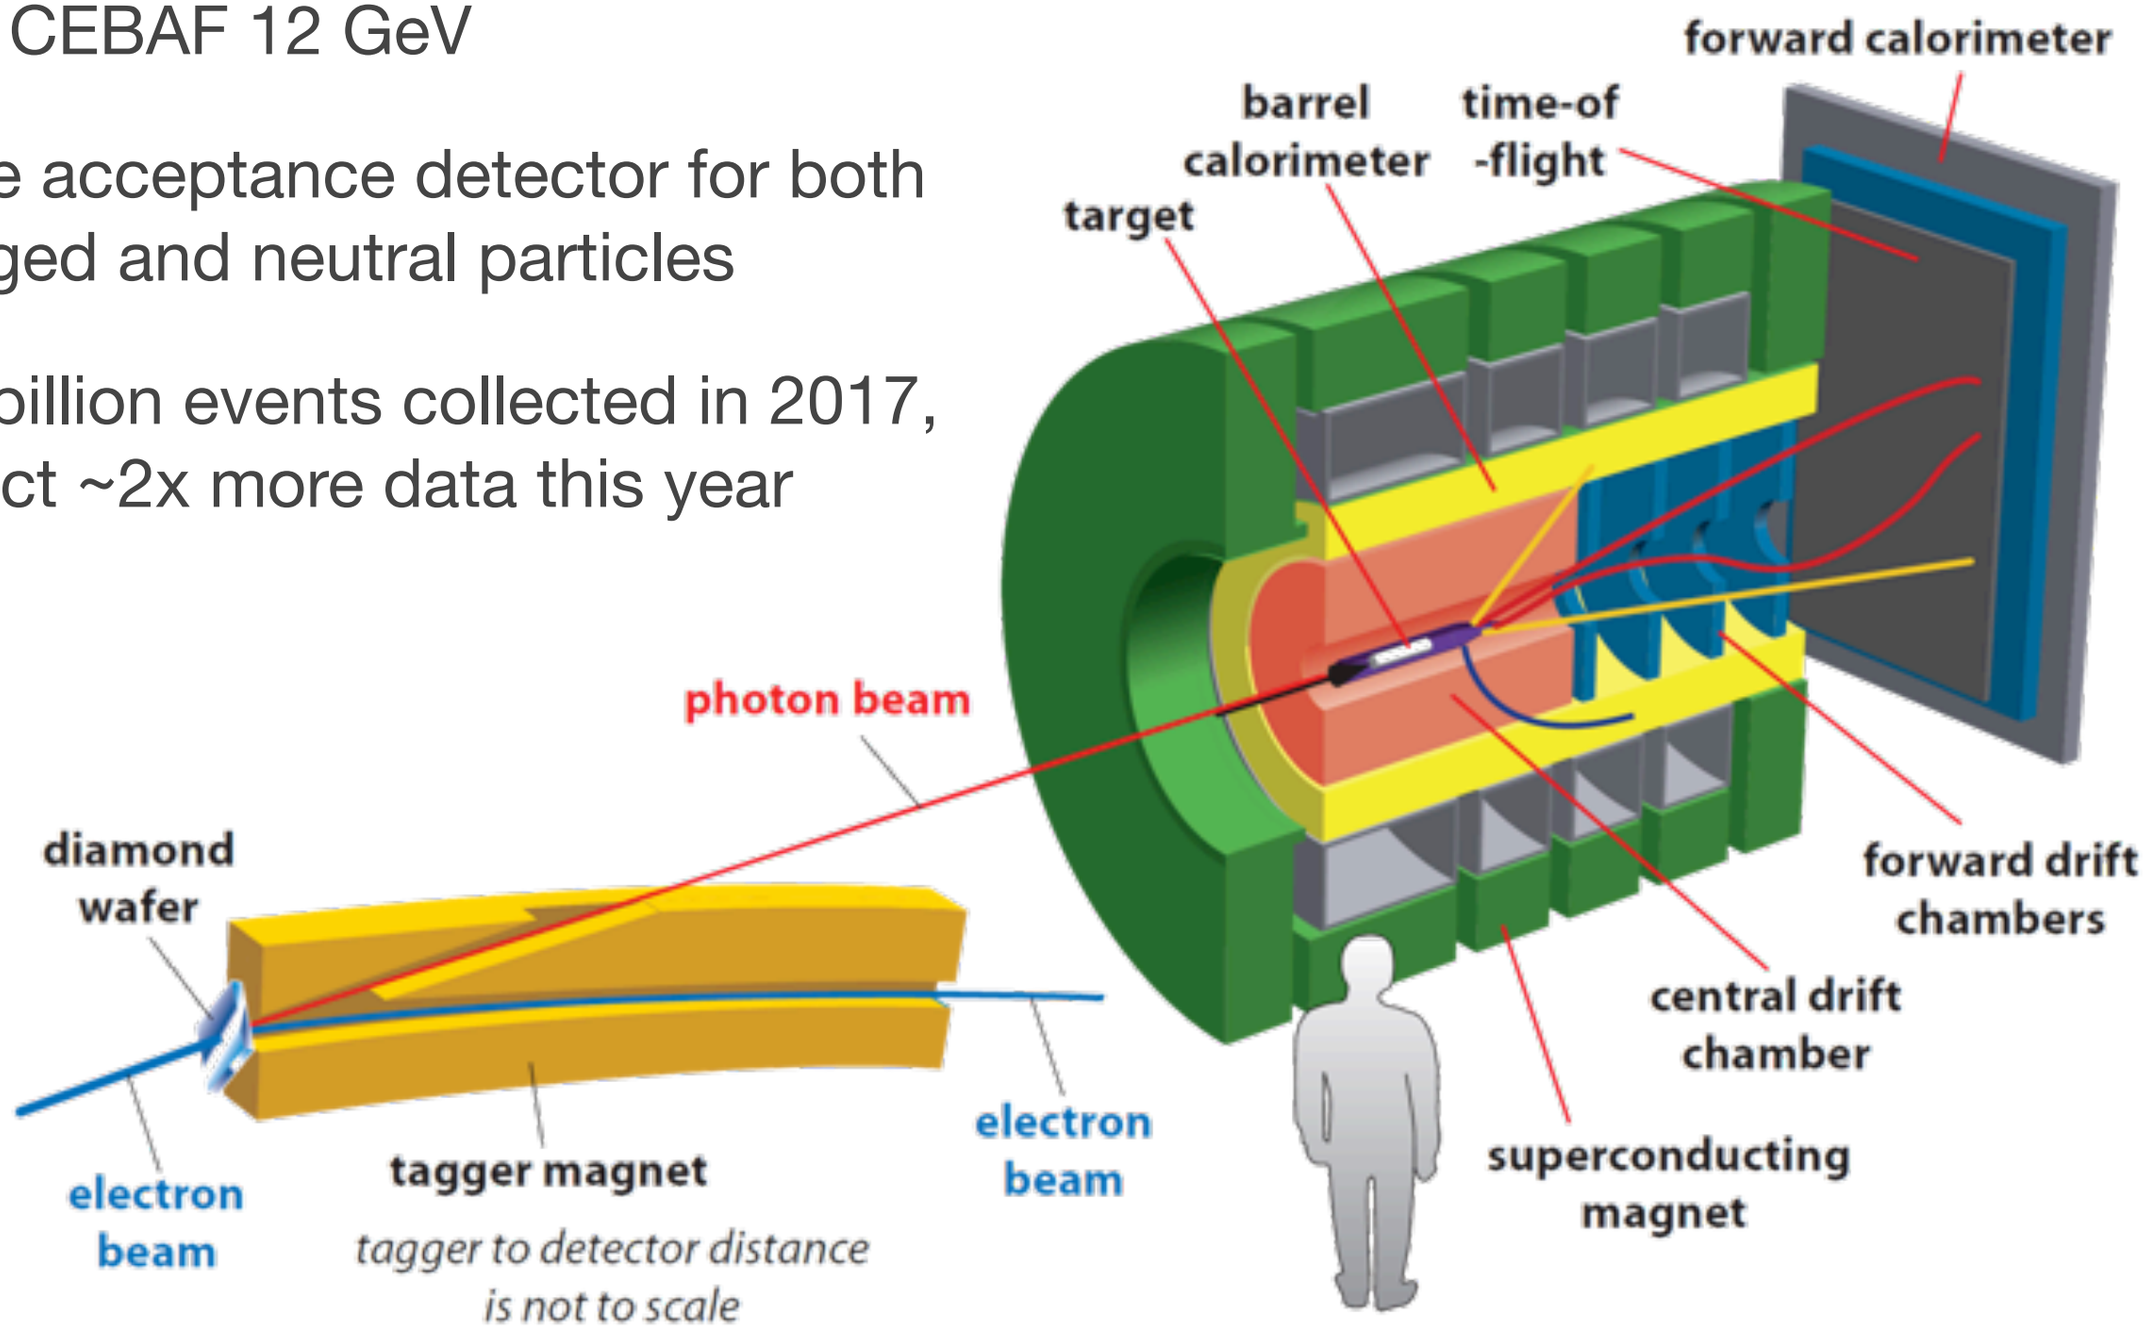
Compass: PLB 740 (2015) 303



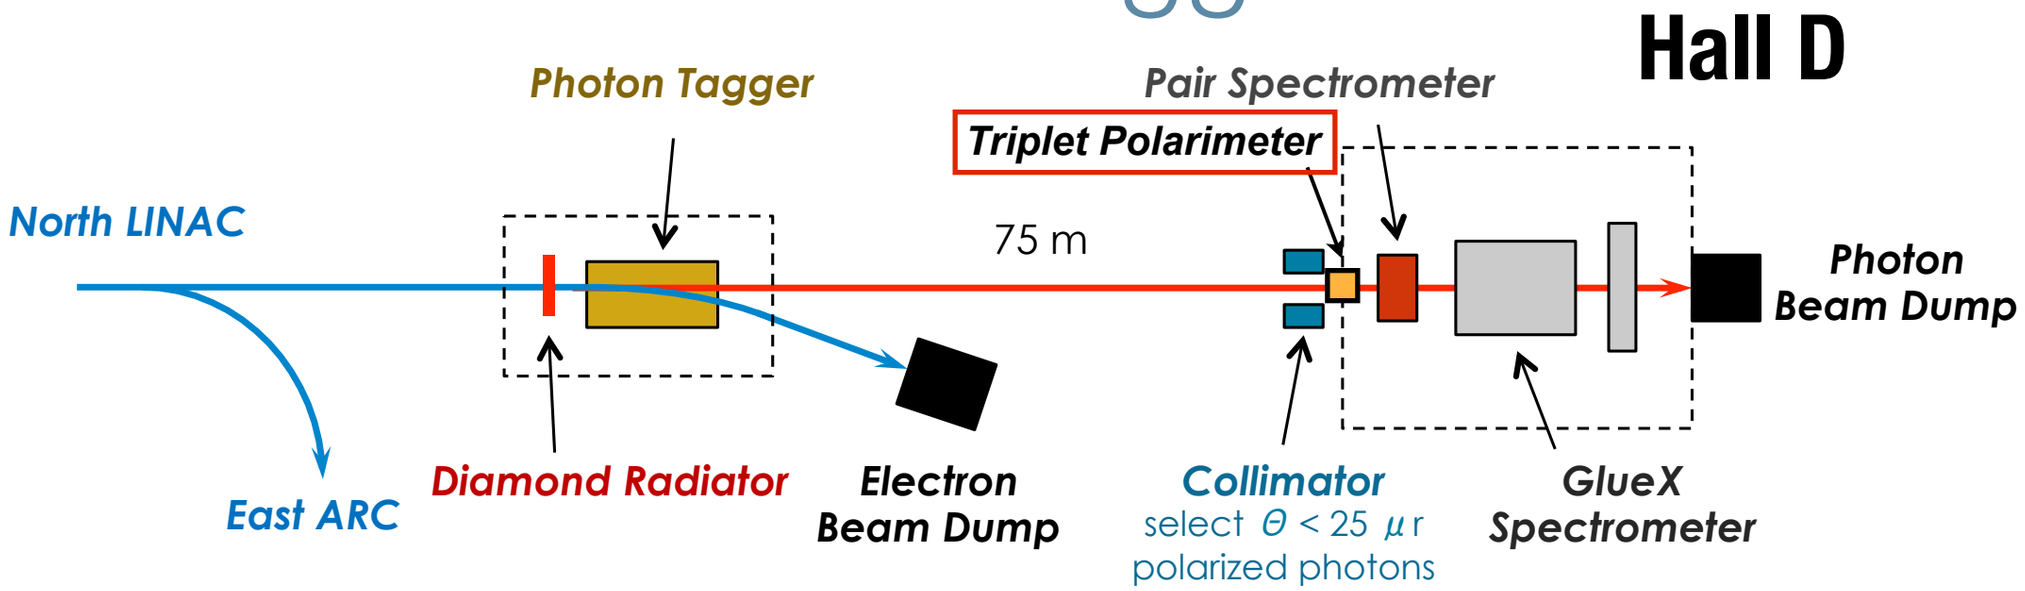
Most experimental searches for hybrids limited to the **π_1 state**

GlueX in Hall D

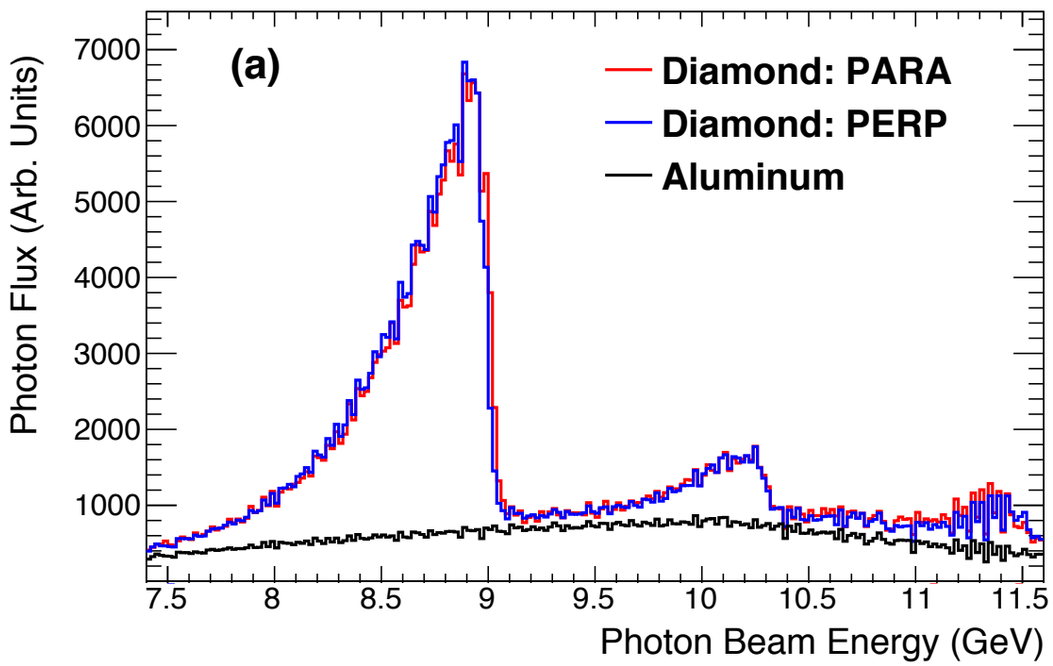
- Linearly polarized photon beam from CEBAF 12 GeV
- Large acceptance detector for both charged and neutral particles
- ~45 billion events collected in 2017, expect ~2x more data this year



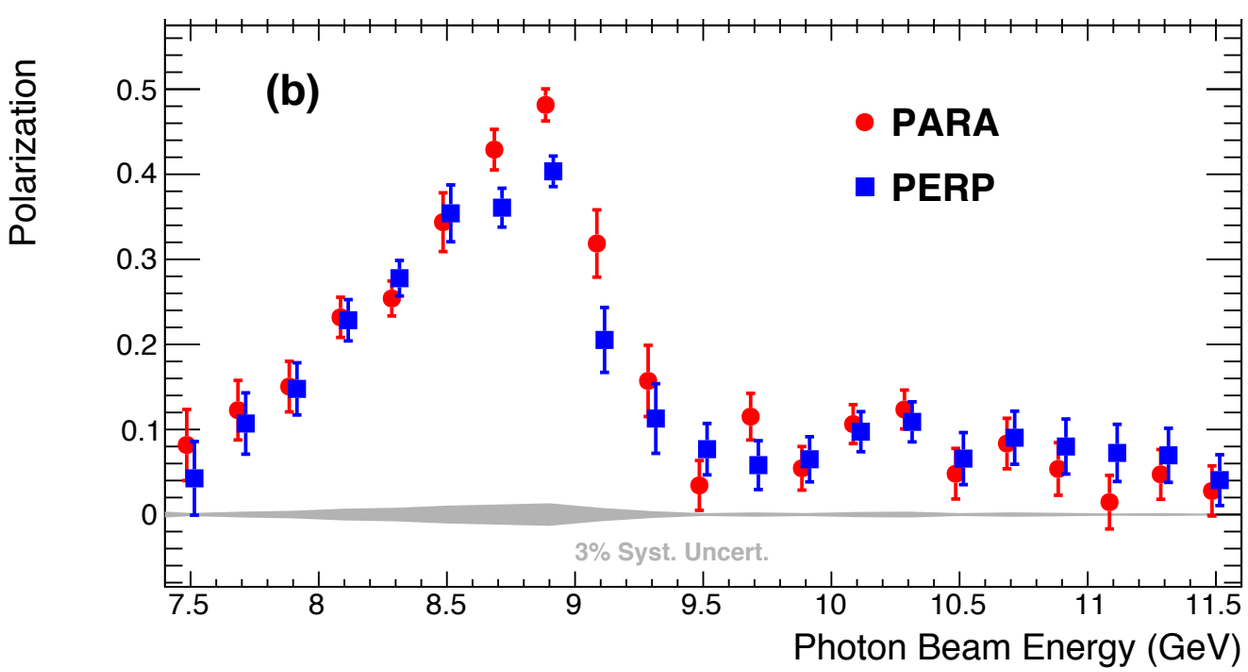
Photon Beam and Tagger



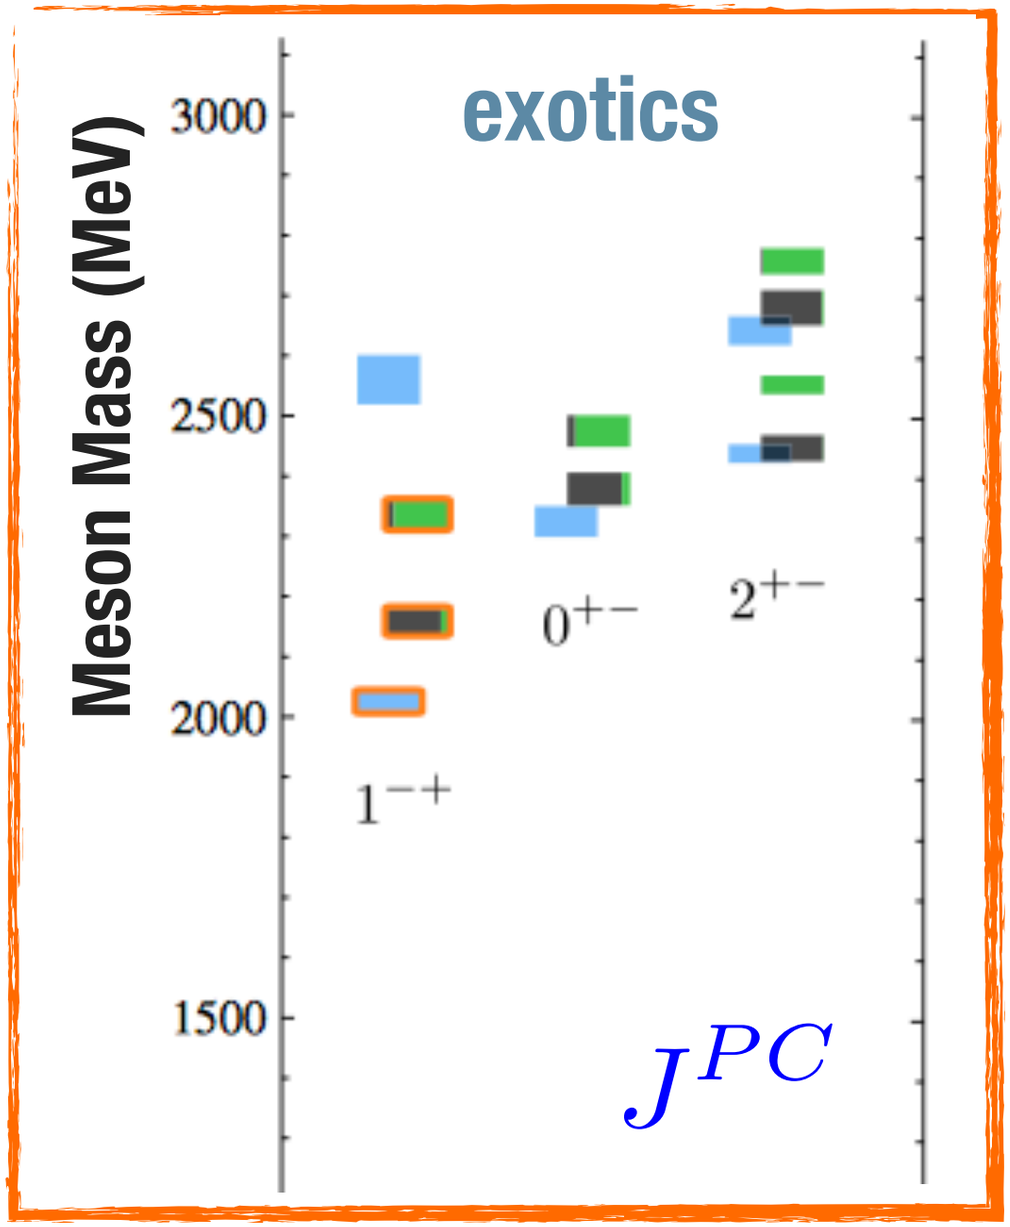
Measured Flux



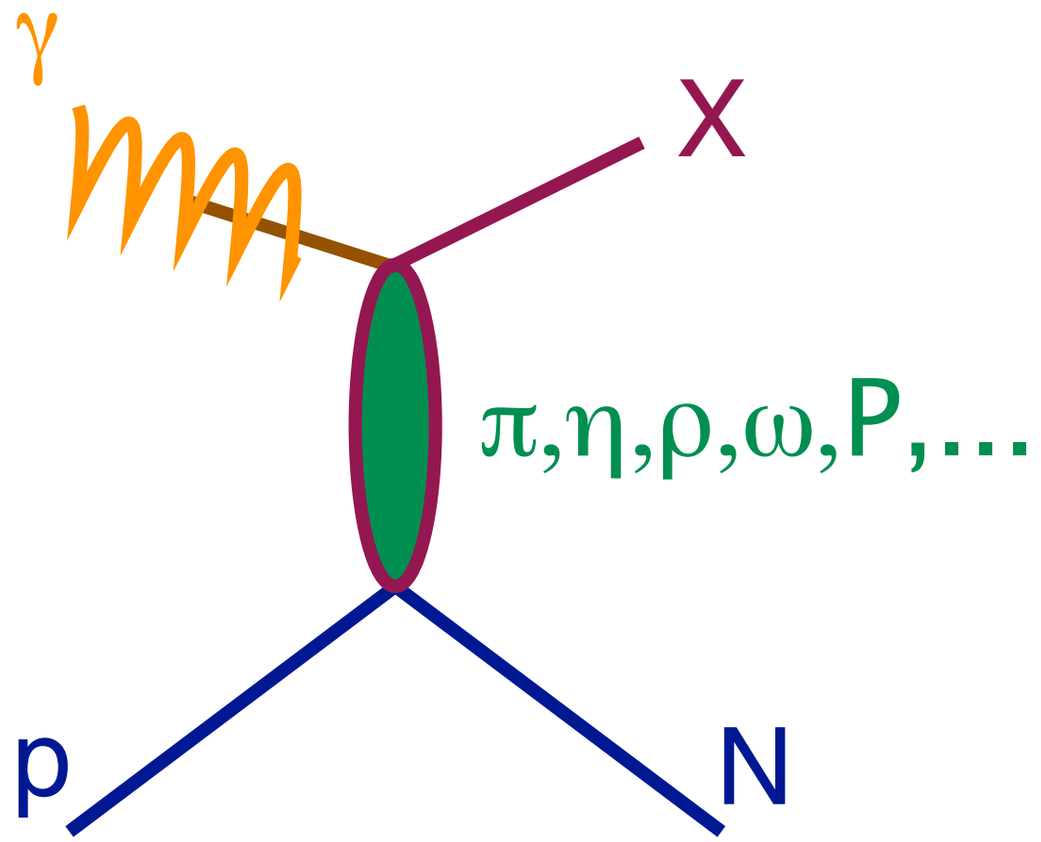
Measured Polarization



Exotic J^{PC} in photoproduction

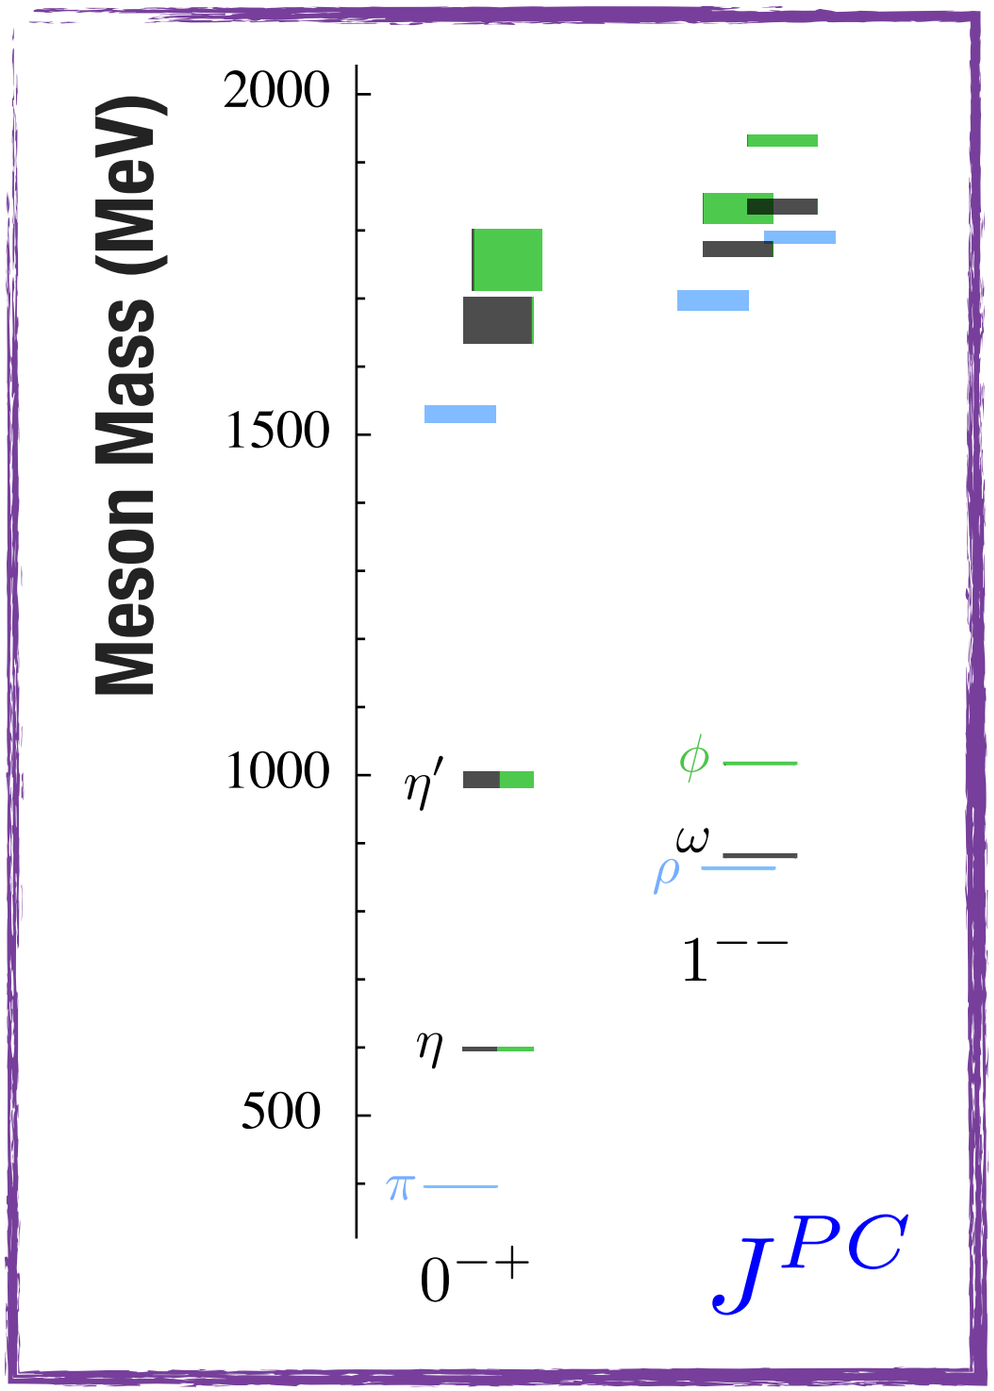


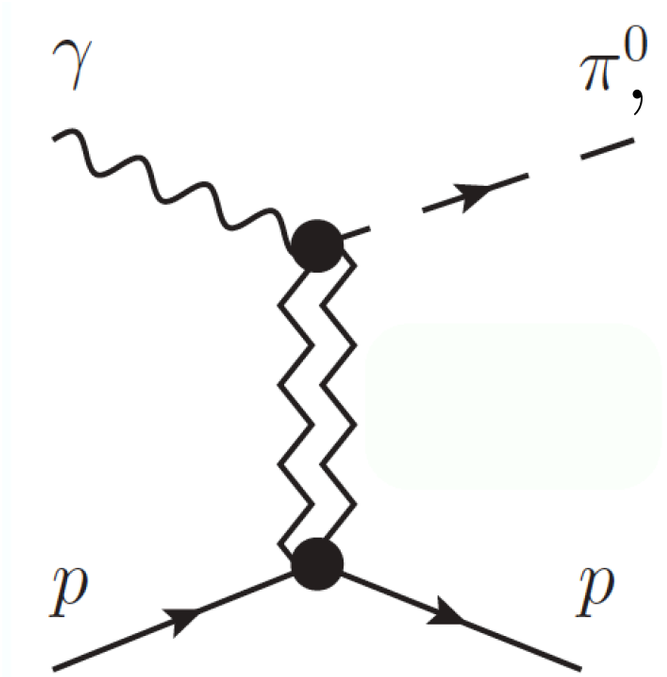
Meson X with particular J^{PC}



Production through t-channel "quasi-particle" exchange

Non-exotic J^{PC} in photoproduction





Exchange J^{PC}

$1^{--} : \omega, \rho$

$1^{+-} : b, h$

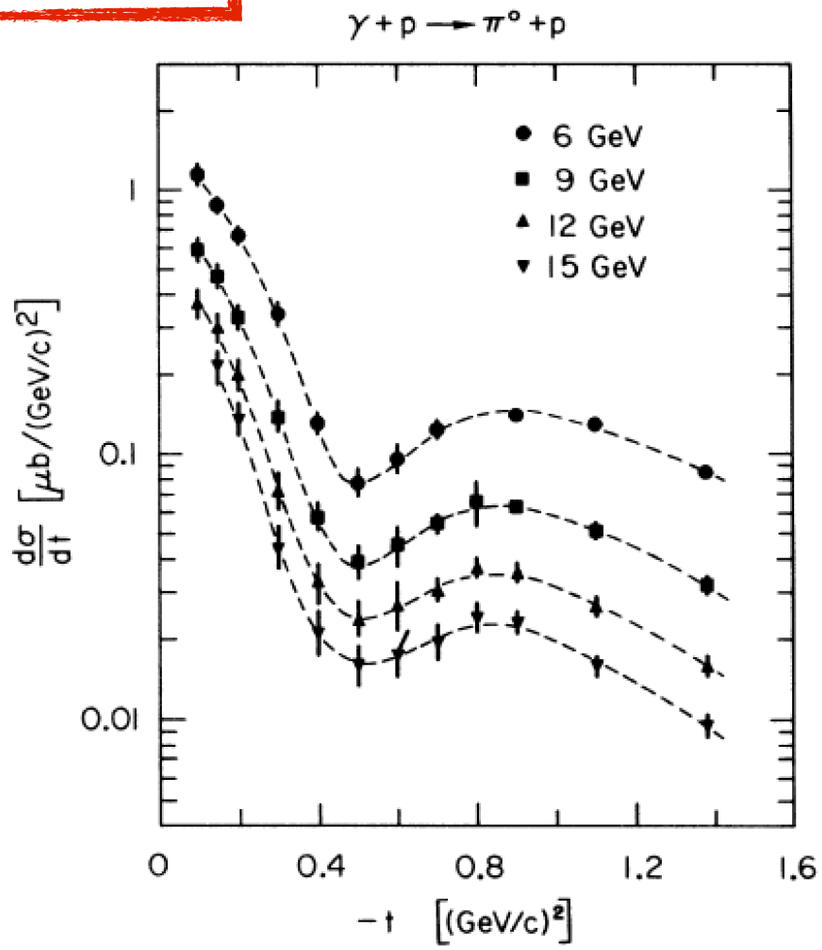
- Begin by understanding non-exotic production mechanism
- Linear photon beam polarization critical to filter out “naturality” of the exchange particle

Early GlueX physics: $\gamma p \to \pi^0 p$

High-Energy π^0 Photoproduction from Hydrogen with Unpolarized and Linearly Polarized Photons*

R. L. Anderson, D. B. Gustavson, J. R. Johnson, I. D. Overman, D. M. Ritson, and B. H. Wiik
Stanford Linear Accelerator Center, Stanford, California 94305
and
D. Worcester†
Harvard University, Cambridge, Massachusetts 02138
(Received 25 June 1971)

1 OCTOBER 1971



Early GlueX physics: $\gamma p \to \pi^0 p$

High-Energy π^0 Photoproduction from Hydrogen with Unpolarized and Linearly Polarized Photons*

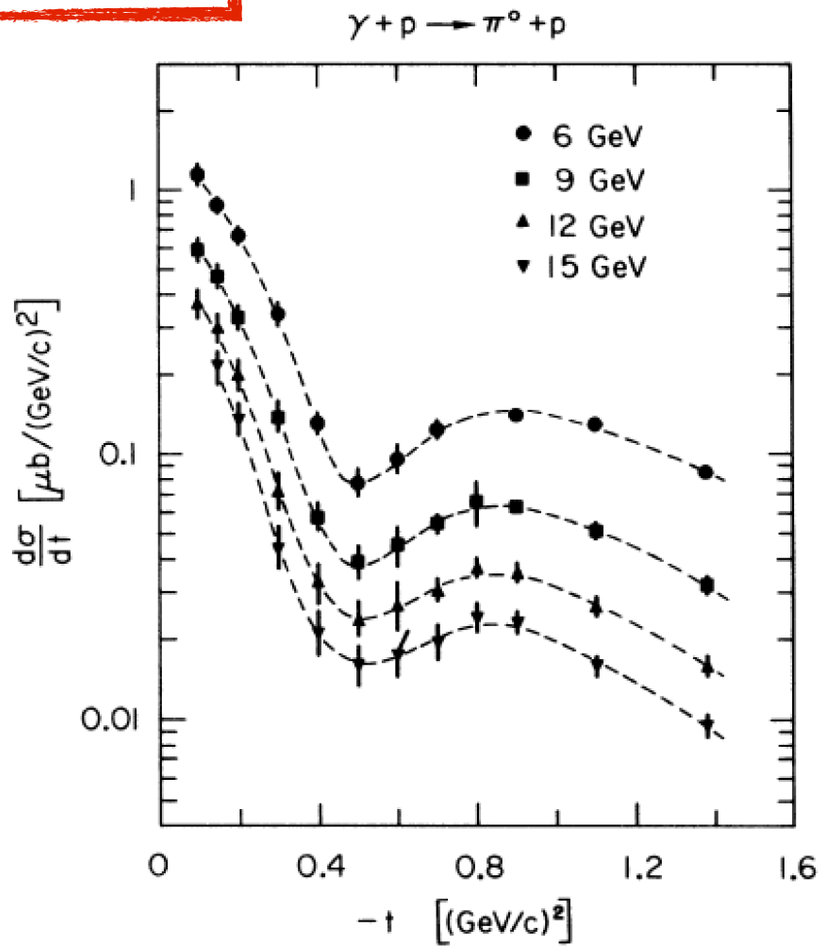
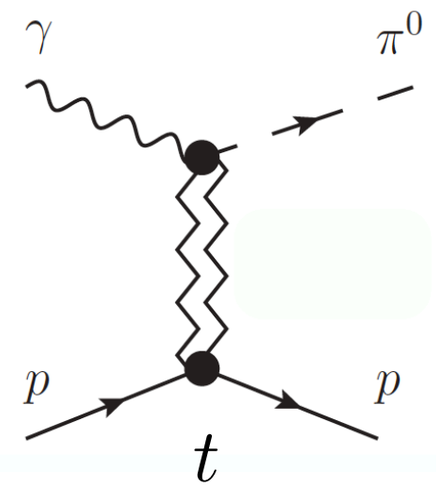
1 OCTOBER 1971



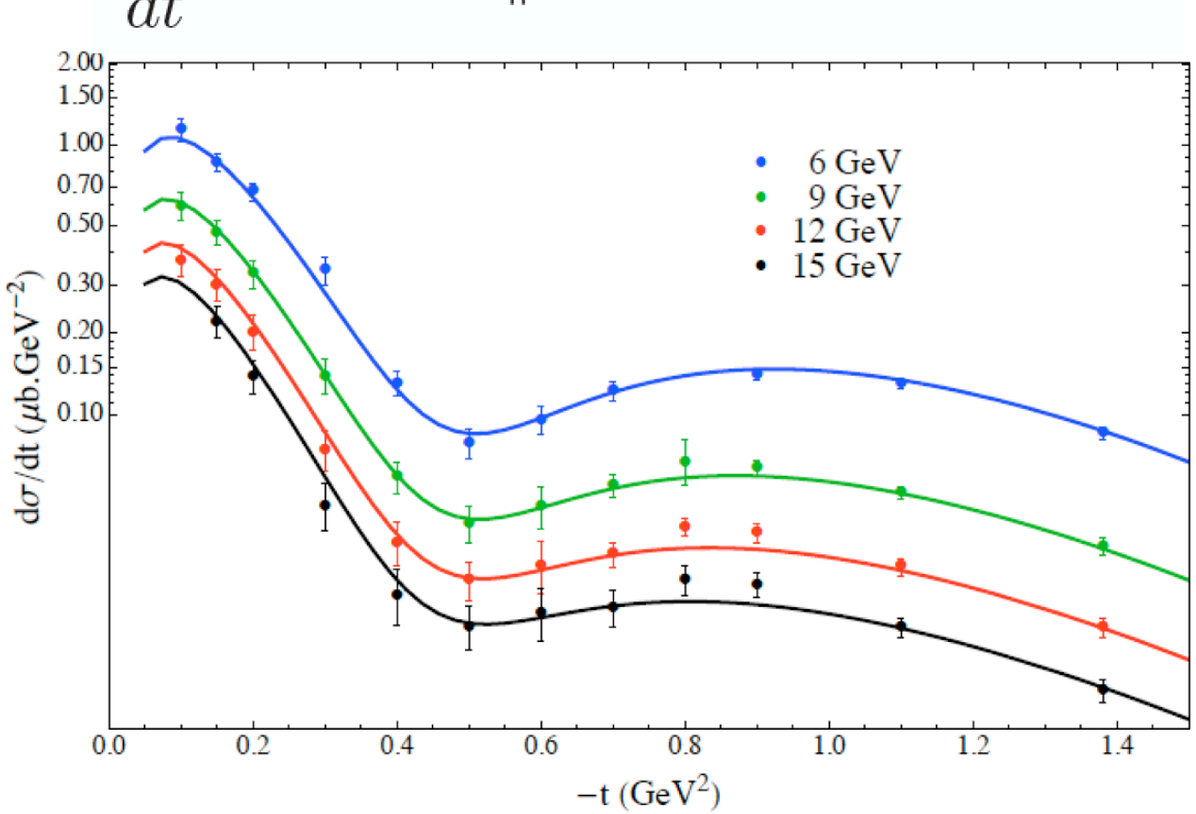


Exchange J^{PC}

$1^{--} : \omega, \rho$

$1^{+-} : b, h$

$$\frac{d\sigma}{dt} = \sigma_\perp + \sigma_\parallel = |\rho + \omega|^2 + |b + h|^2$$

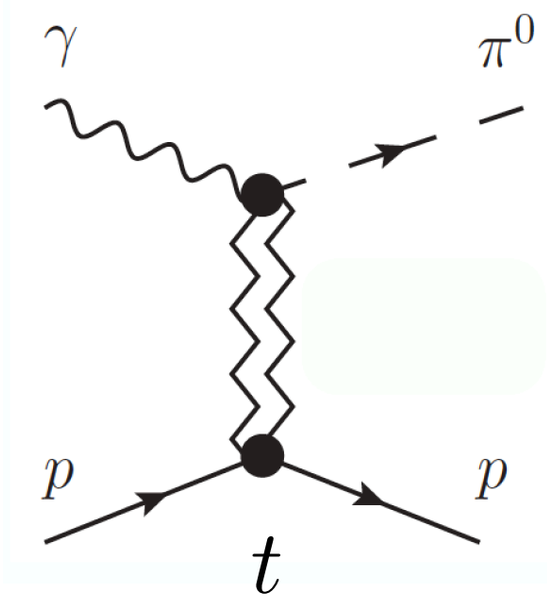


JPAC: Mathieu et al. PRD 92, 074013

γp→π⁰p beam asymmetry Σ

- Beam asymmetry Σ provides insight into dominant production mechanism

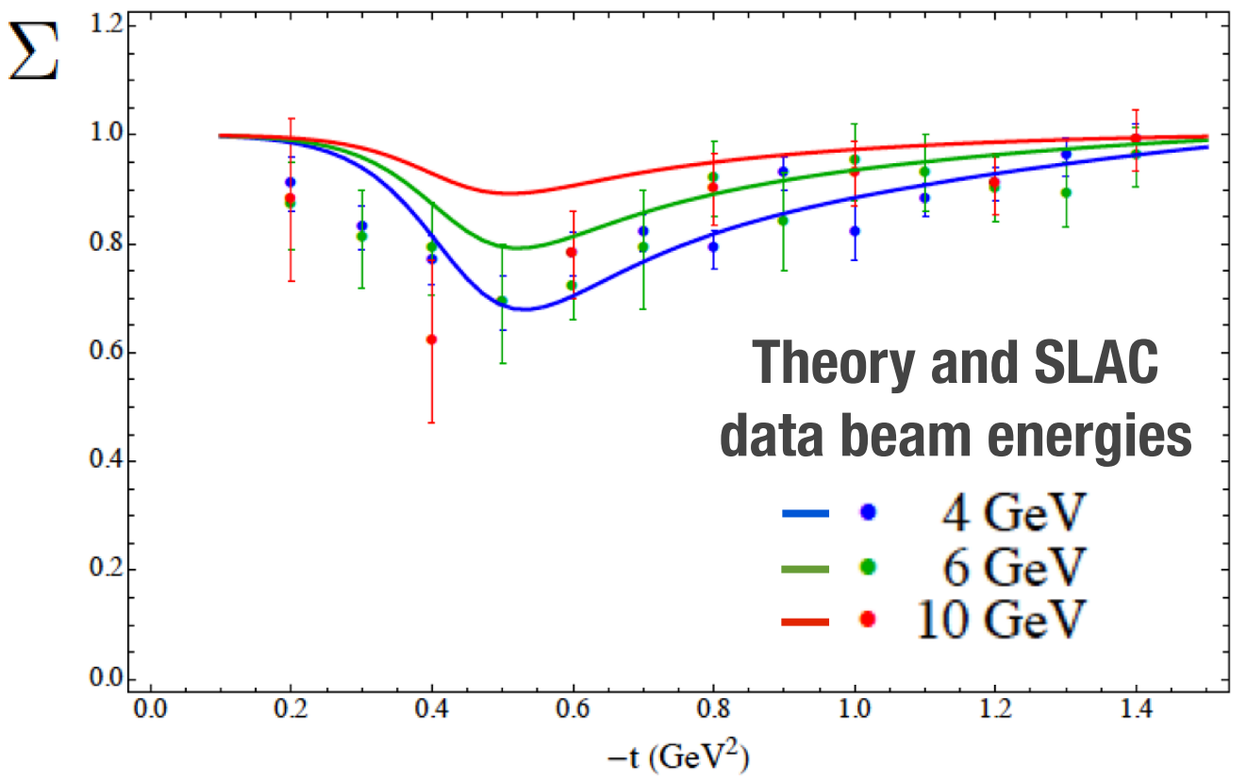
$$\Sigma = \frac{|\omega + \rho|^2 - |h + b|^2}{|\omega + \rho|^2 + |h + b|^2}$$



Exchange J^{PC}

$1^{--} : \omega, \rho$

$1^{+-} : b, h$

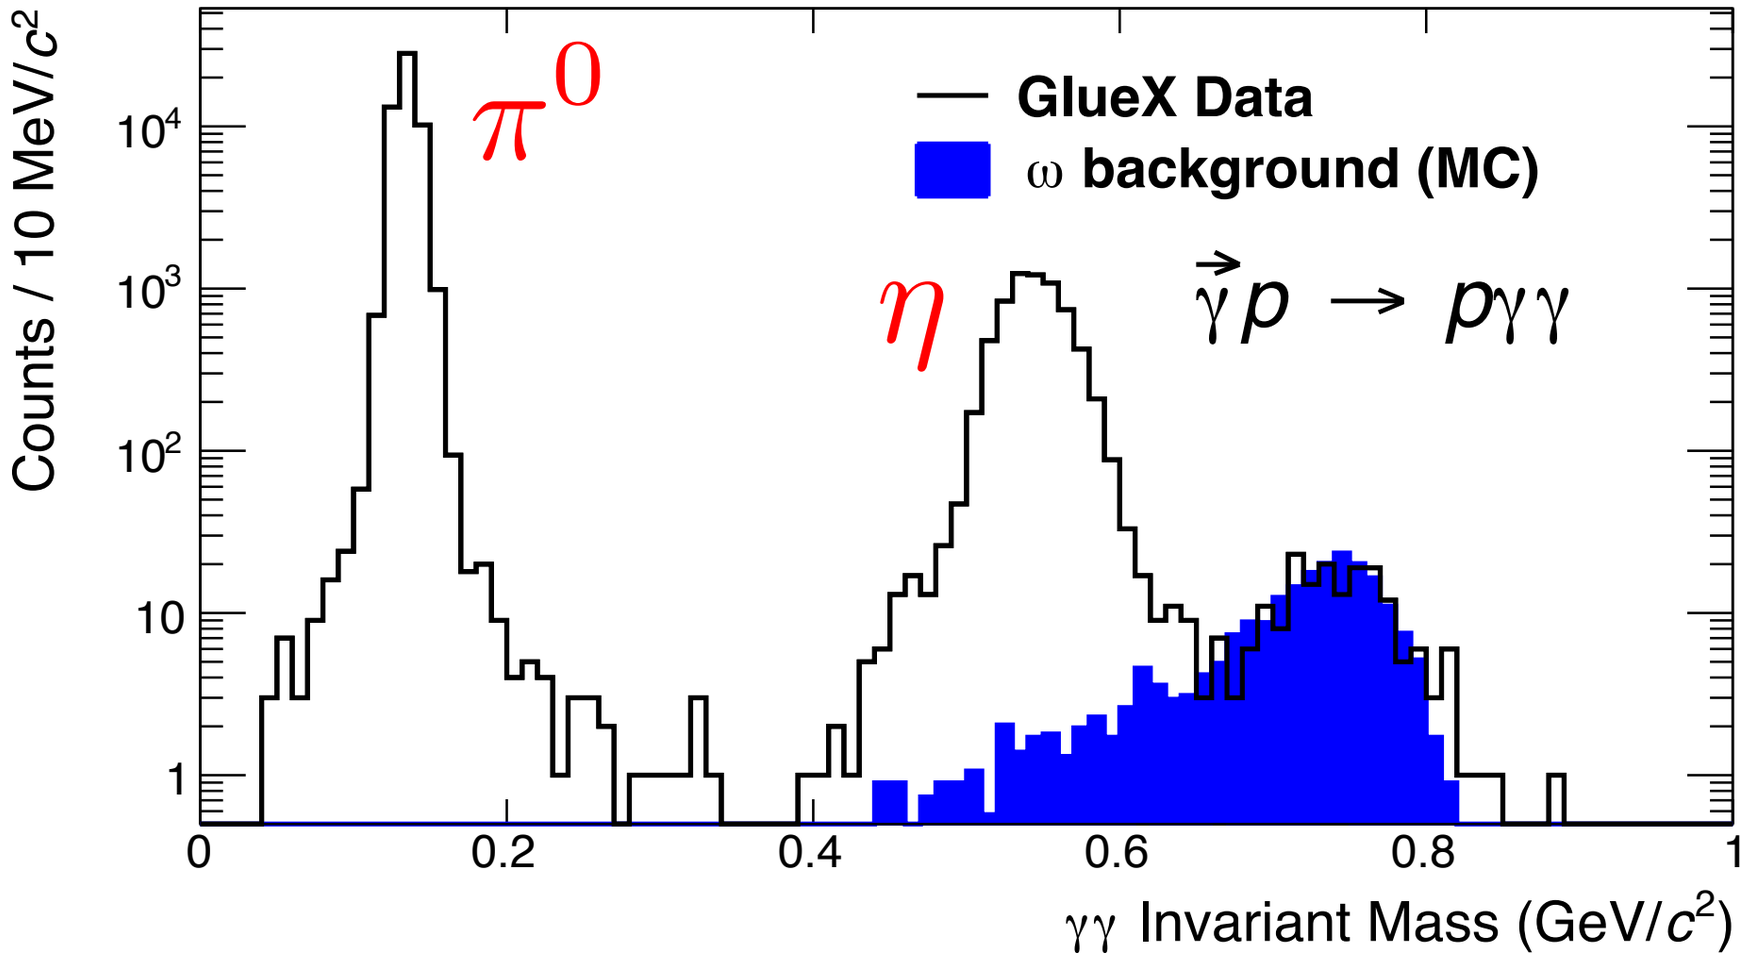


- From experimental standpoint it's easily extended to γp→ηp
  - **No previous measurements!**

JPAC: Mathieu et al. PRD 92, 074013

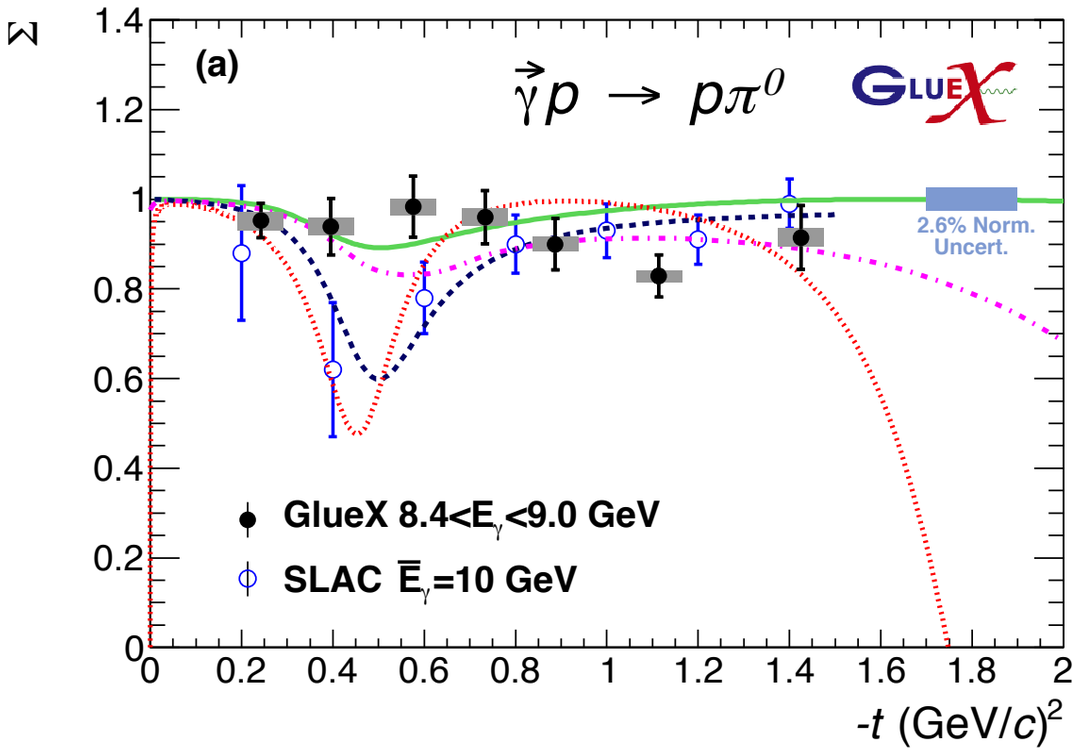
π^0 and η beam asymmetries

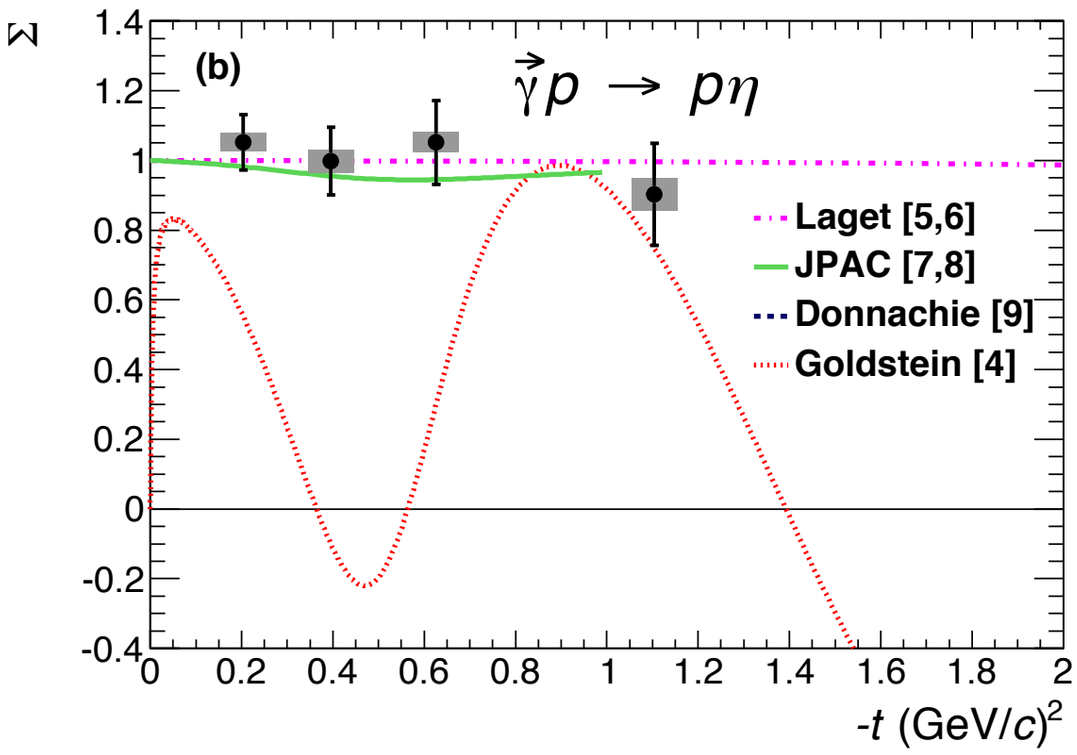
$$\gamma p \to p\gamma\gamma$$



Phys. Rev. C 95, 042201(R)

π^0 and η beam asymmetries



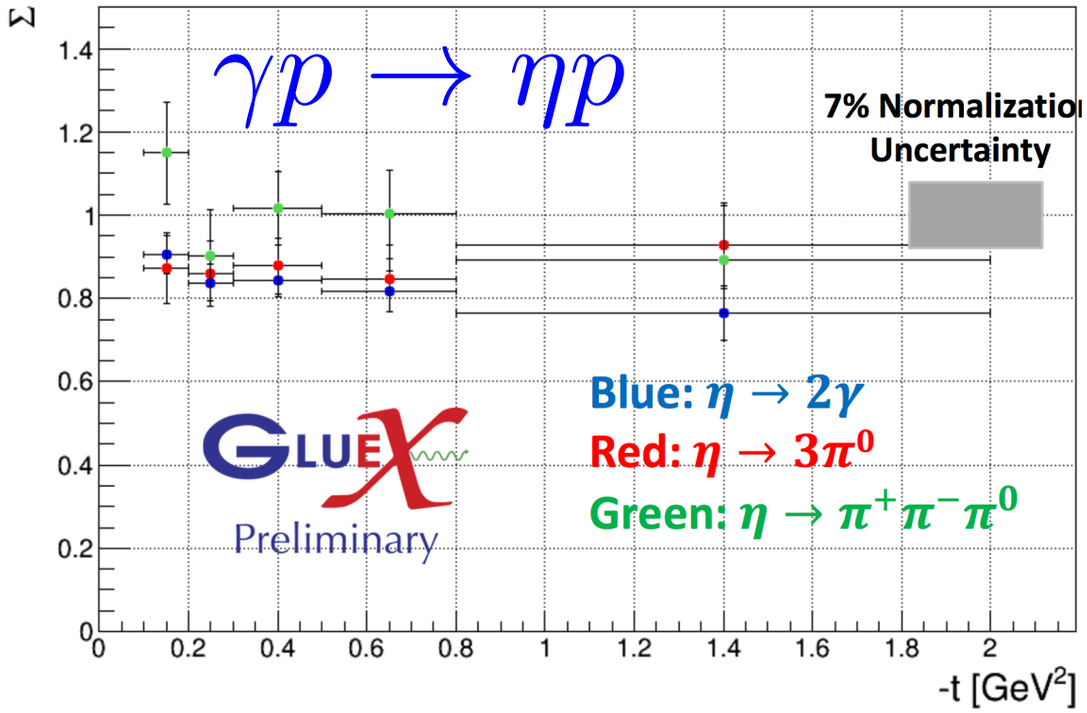


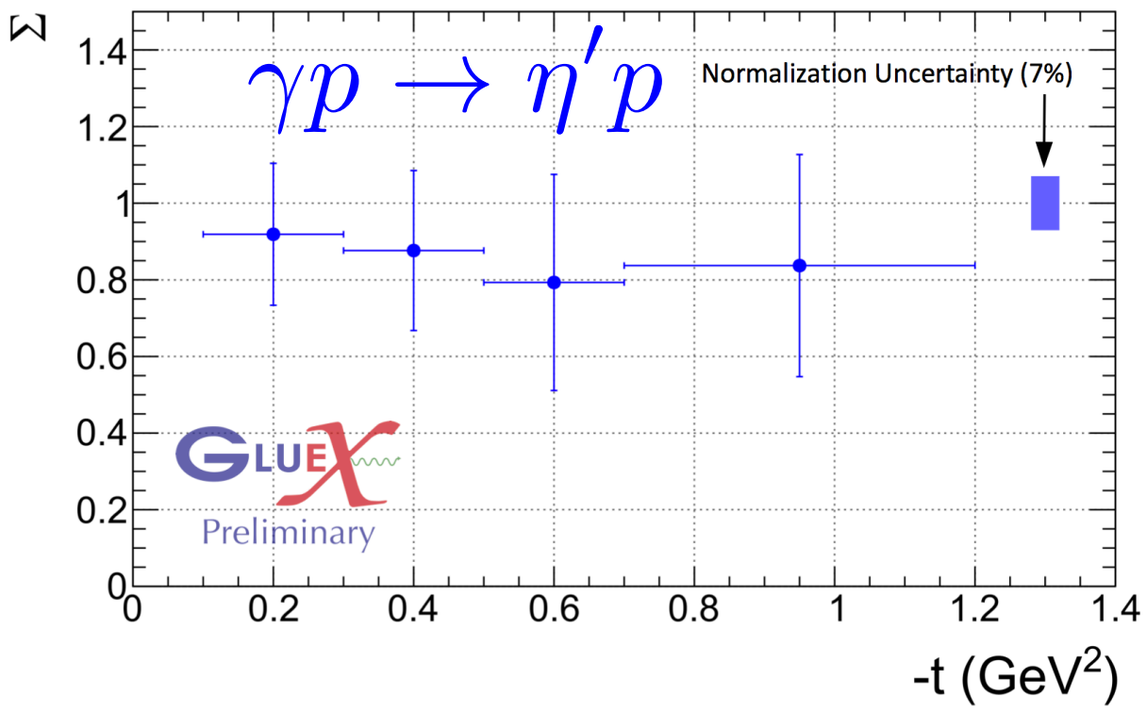
- Dip in multiple theory predictions not observed
- Indication of vector exchange dominance at this energy
- Additional asymmetry measurements ongoing with this dataset

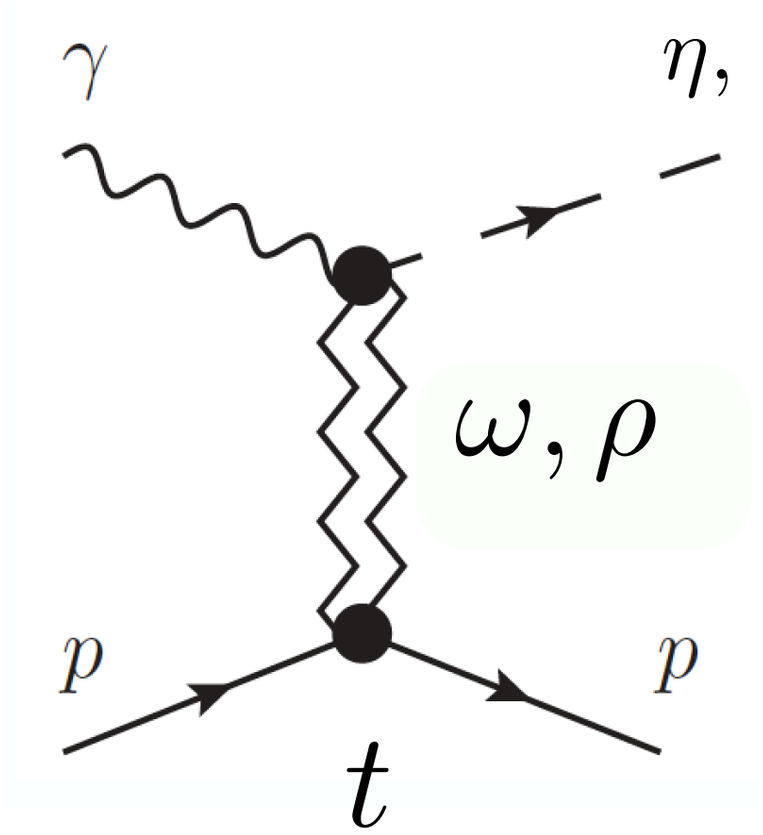
First 12 GeV publication!

Phys. Rev. C 95, 042201(R)

Pseudoscalar beam asymmetries

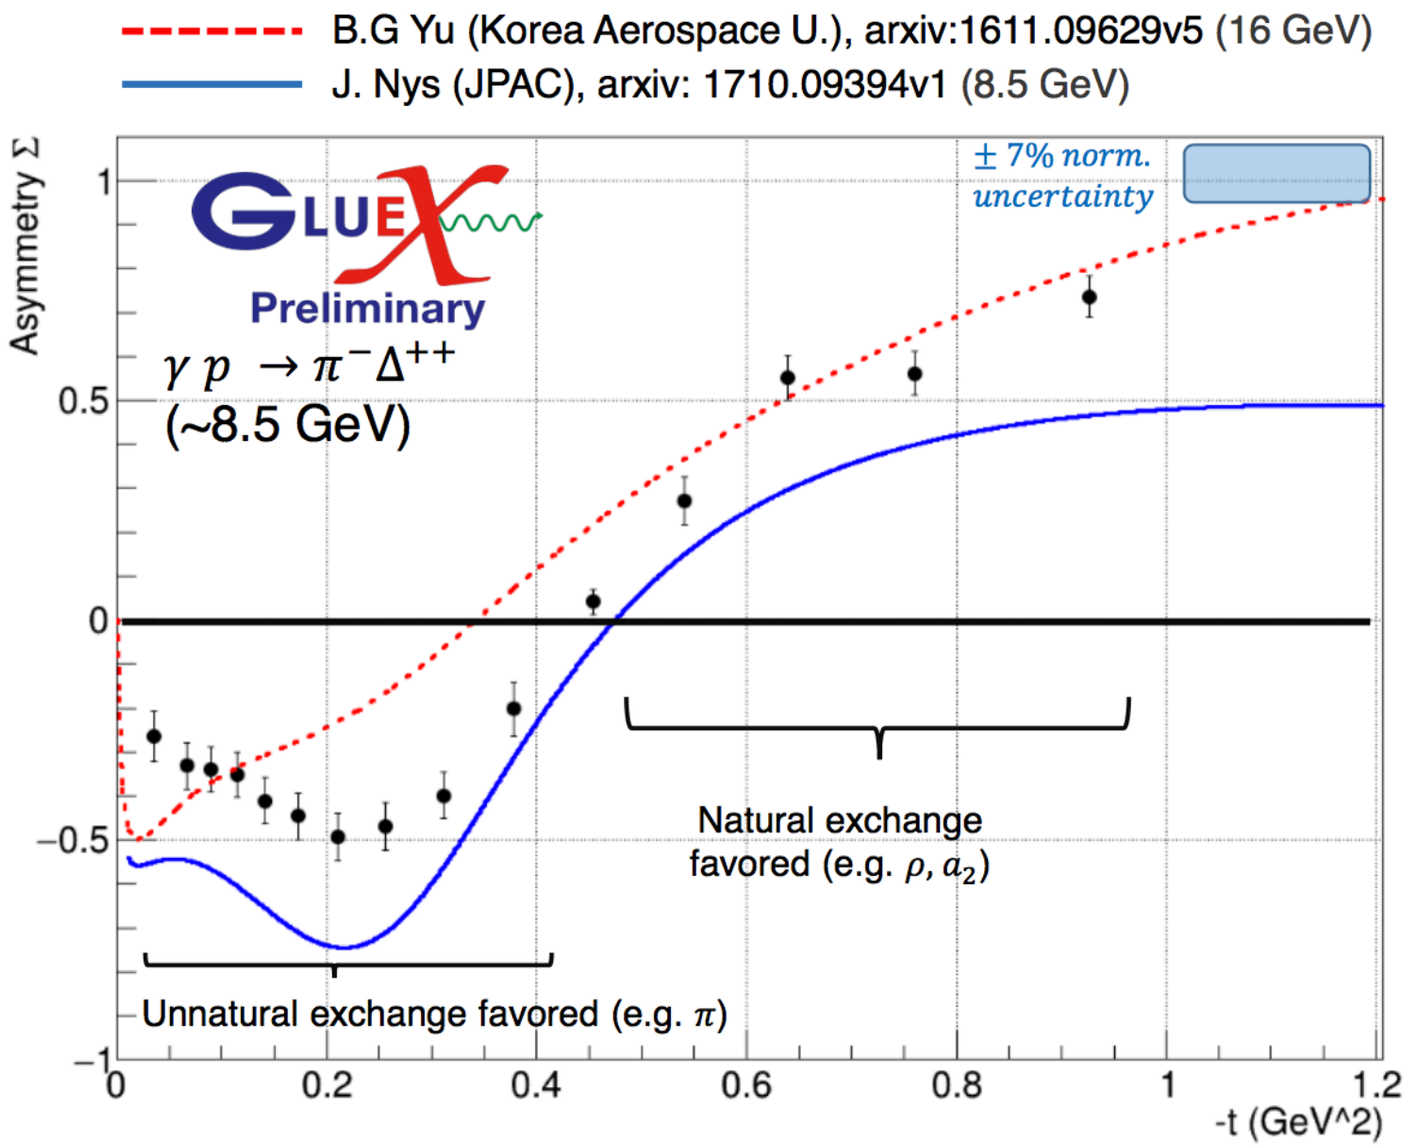


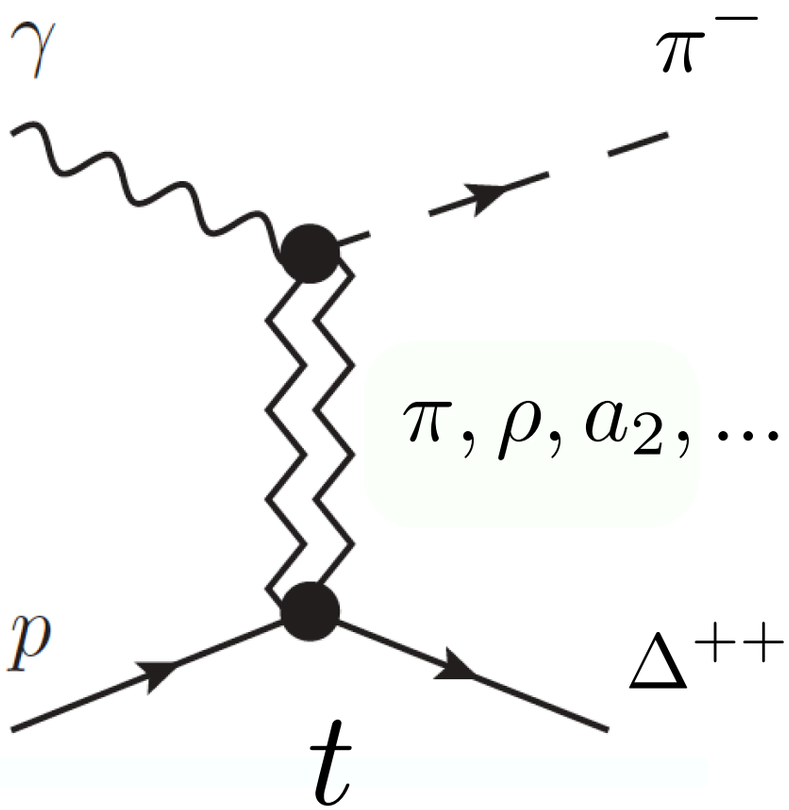




Neutral pseudoscalars: Σ~1, dominated by vector exchange

Pseudoscalar beam asymmetries

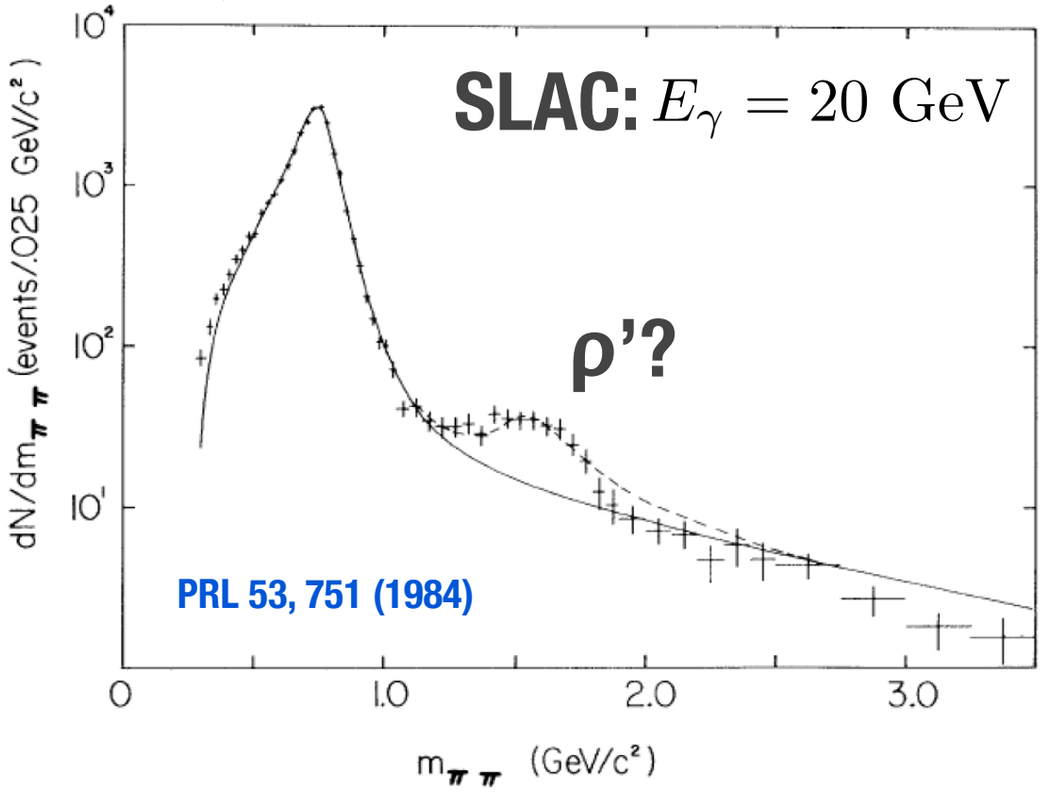


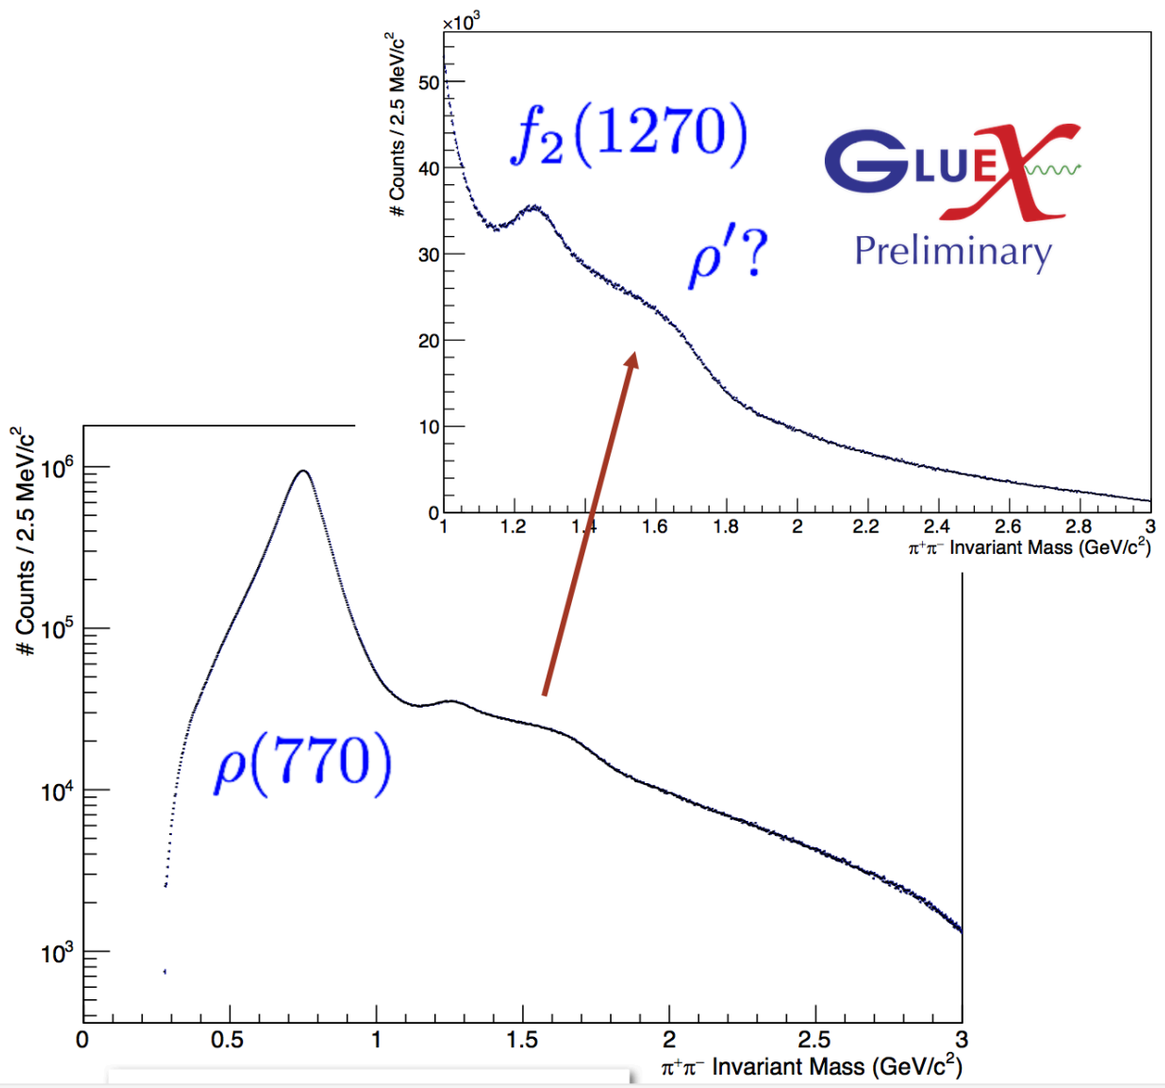


Charged pseudoscalars: more complicated *-t* dependence

Early spectroscopy opportunities

$$\gamma p \to \pi^+ \pi^- p$$



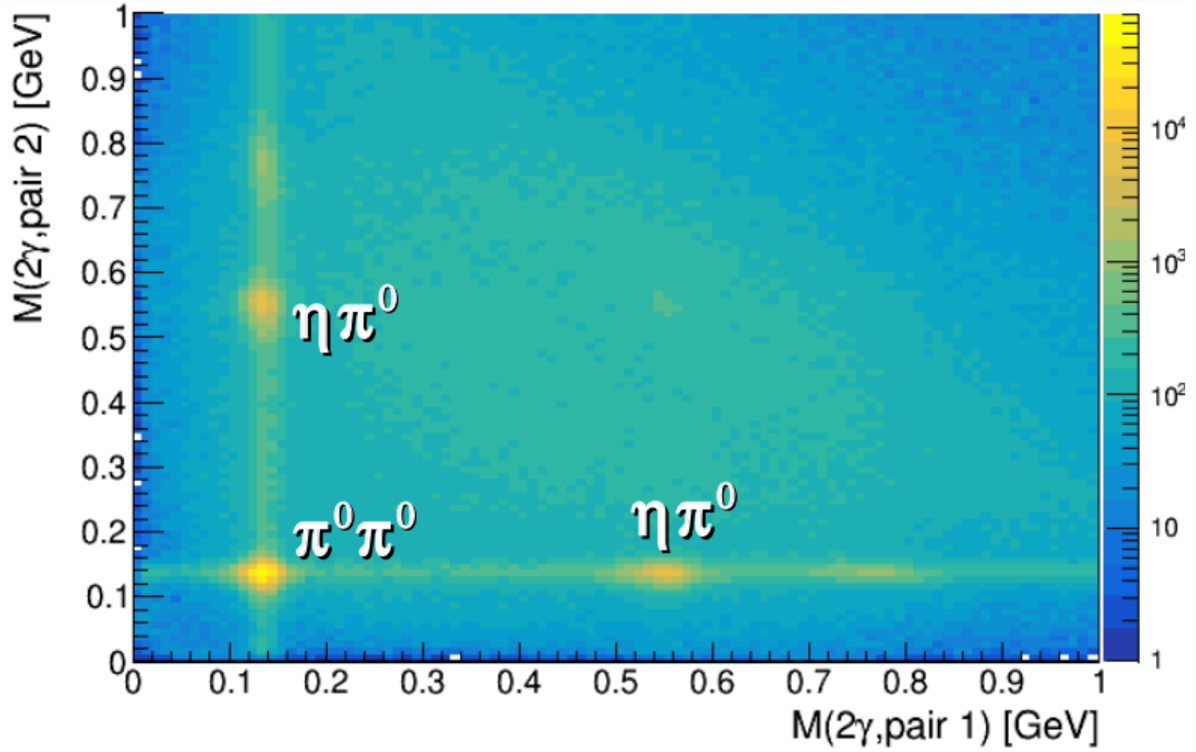


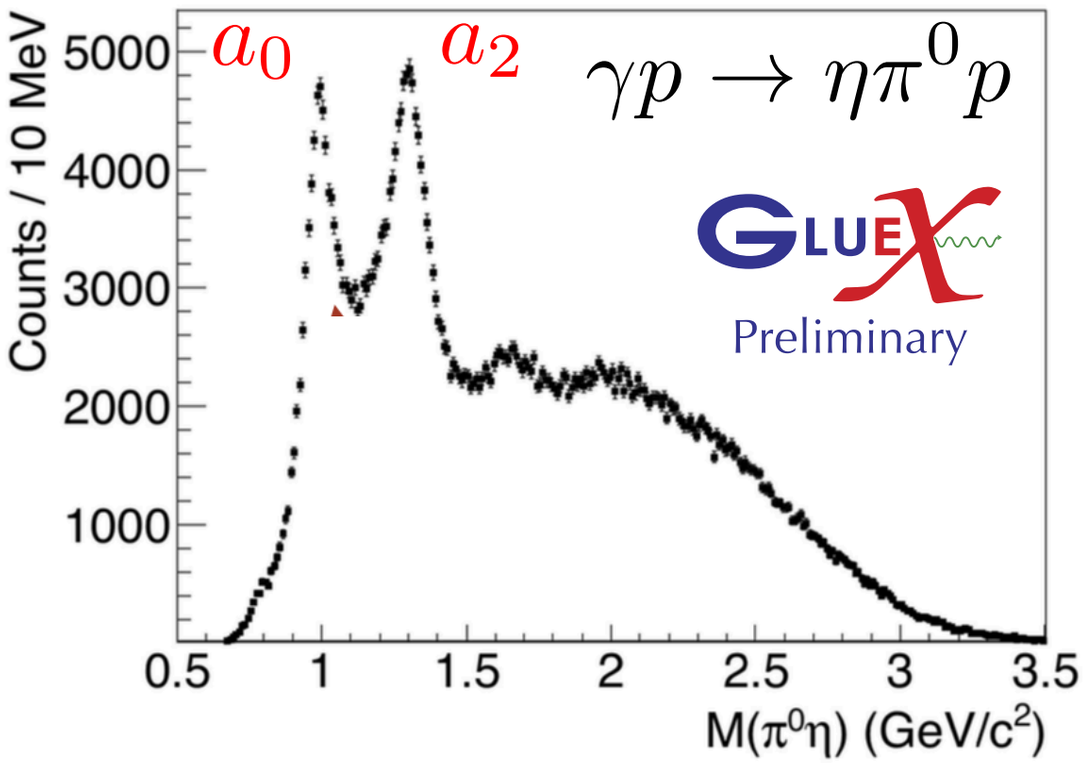
- Enhancement consistent with earlier SLAC measurement, but ~100x more statistics with early GlueX data
- Polarization observables will provide further insight into the nature of this enhancement

Early spectroscopy opportunities

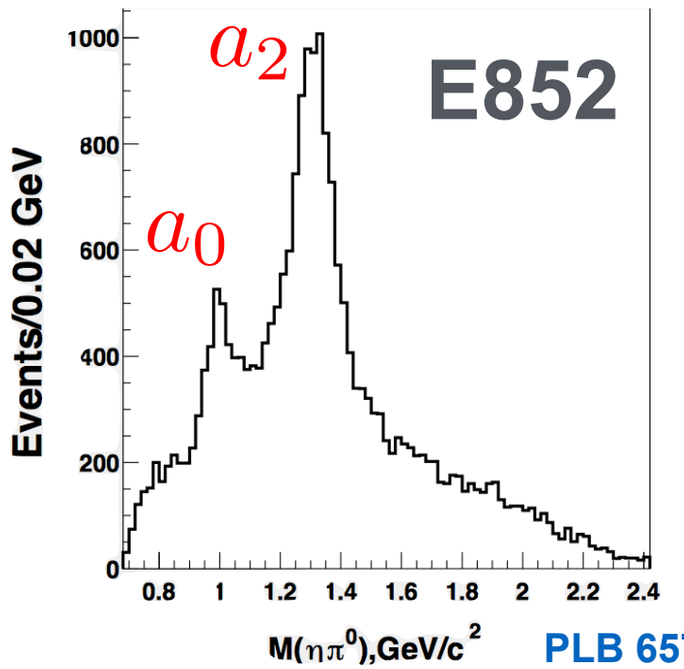
$$\gamma p \to 4\gamma p$$

- Previous photoproduction data very sparse for channels with multiple neutrals particles
- Preliminary studies are already showing interesting features





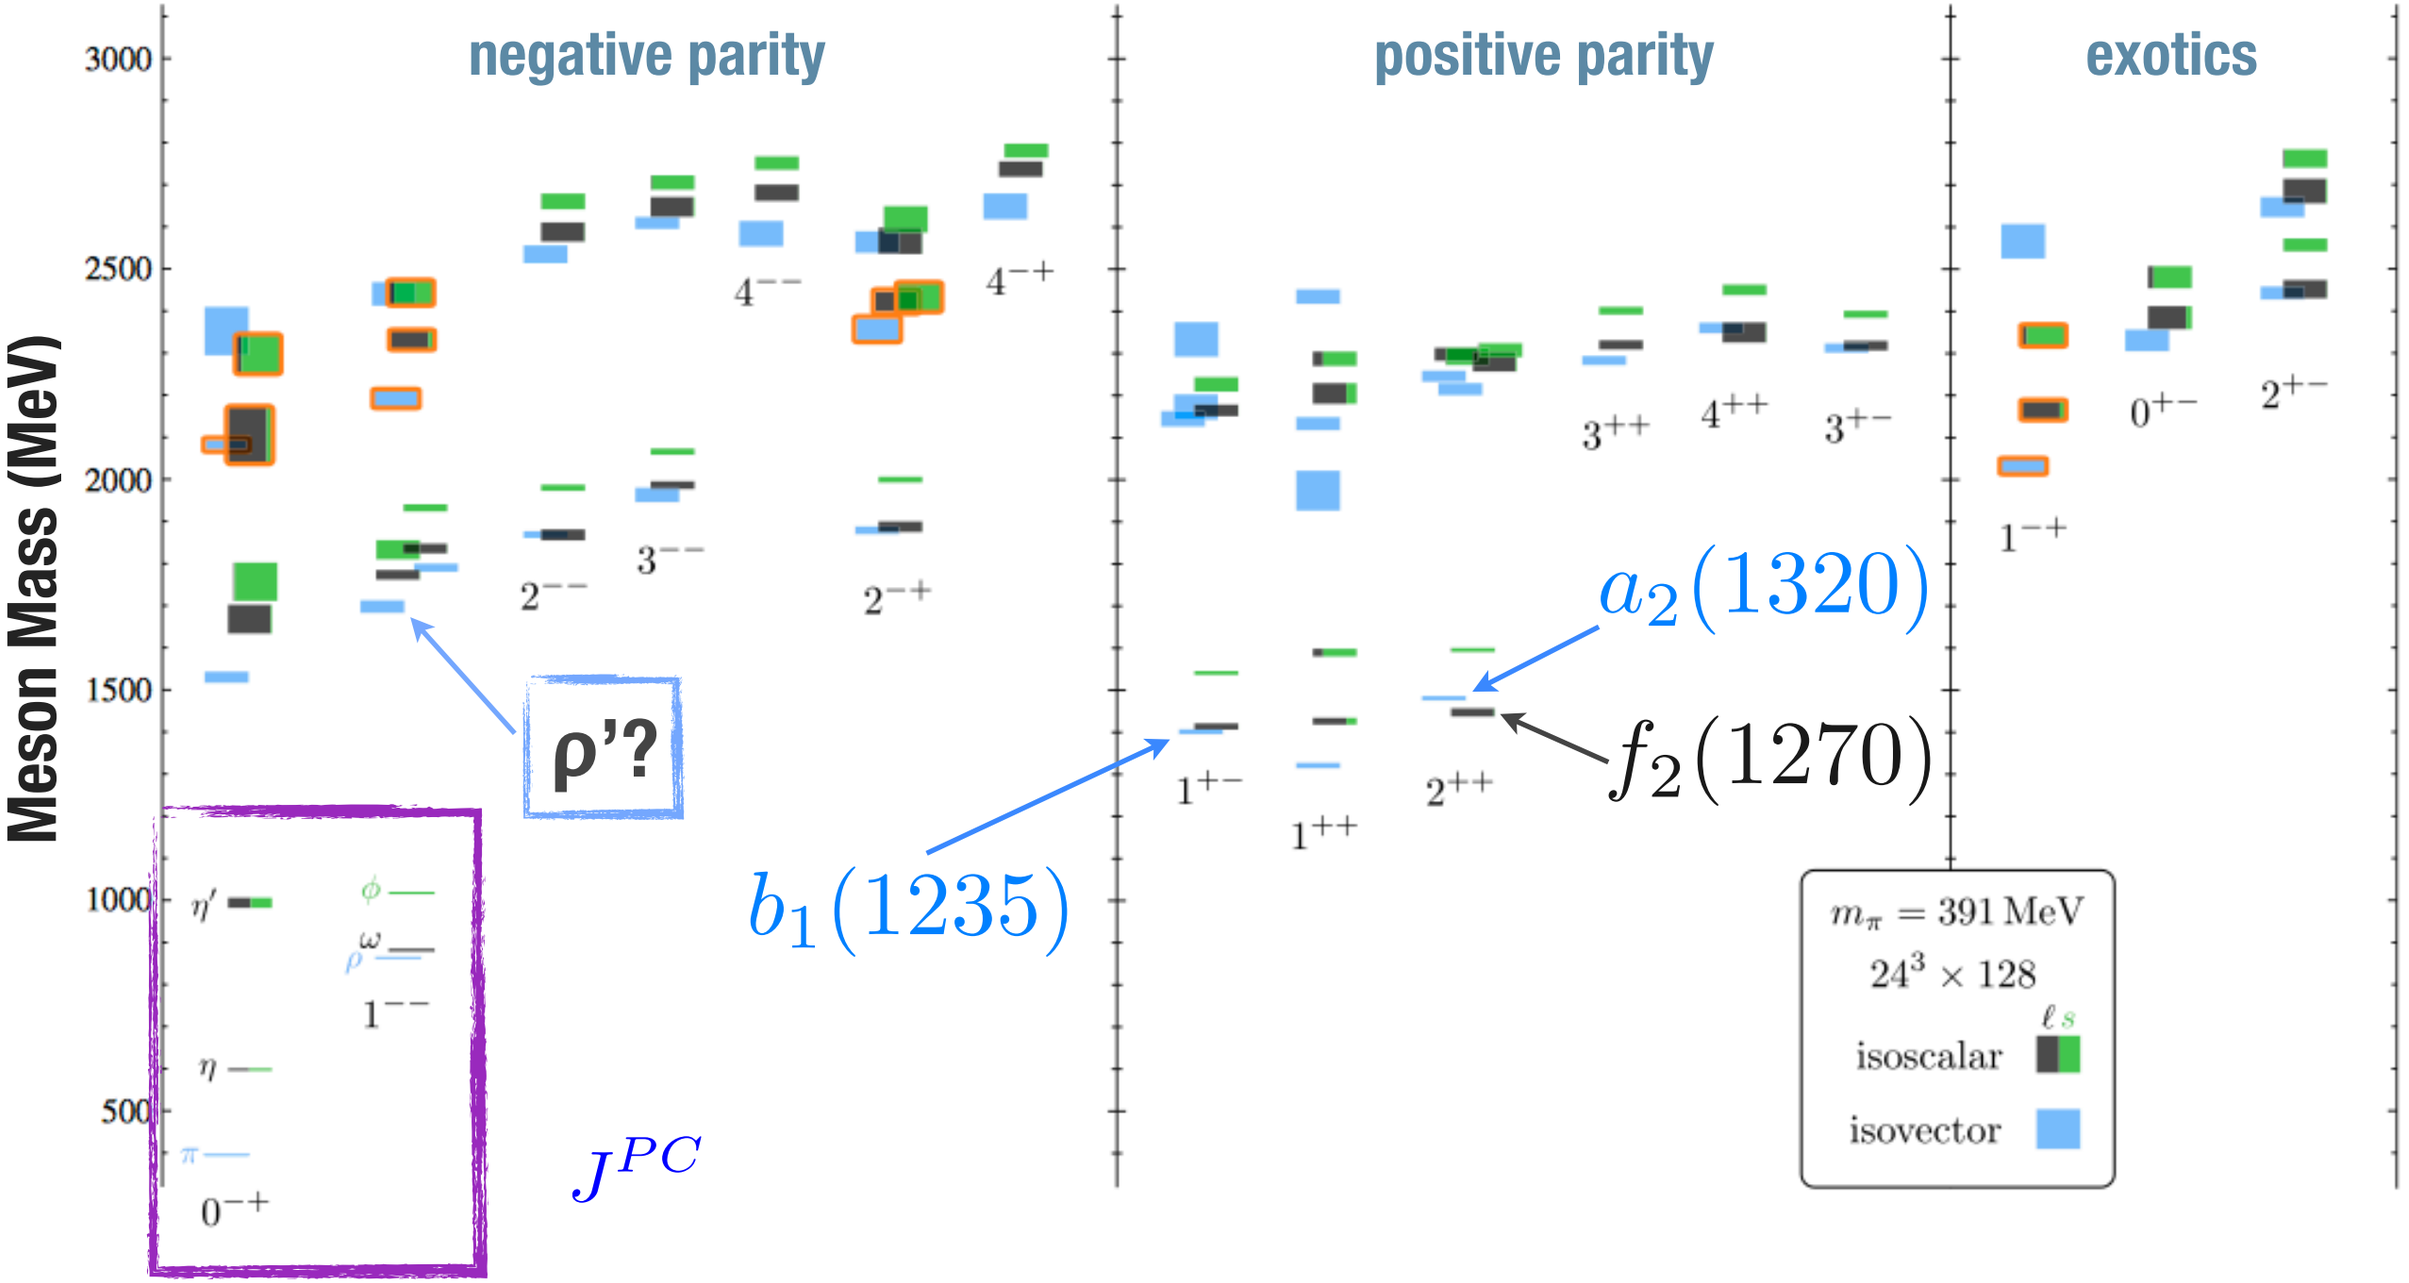
$$\pi^- p \to \eta\pi^0 n$$



PLB 657 (2007) 27

Mapping the meson spectrum

PRD 88 (2013) 094505



- Already studying polarization observables for **"simple" final states**
- Beginning to identify **known mesons** in multi-particle final states

GlueX future

- Lattice predicts **strange** and **light** quark content for mesons
- Search for a **pattern** of hybrid states in many final states
- Requires clean identification of charged pions and kaons

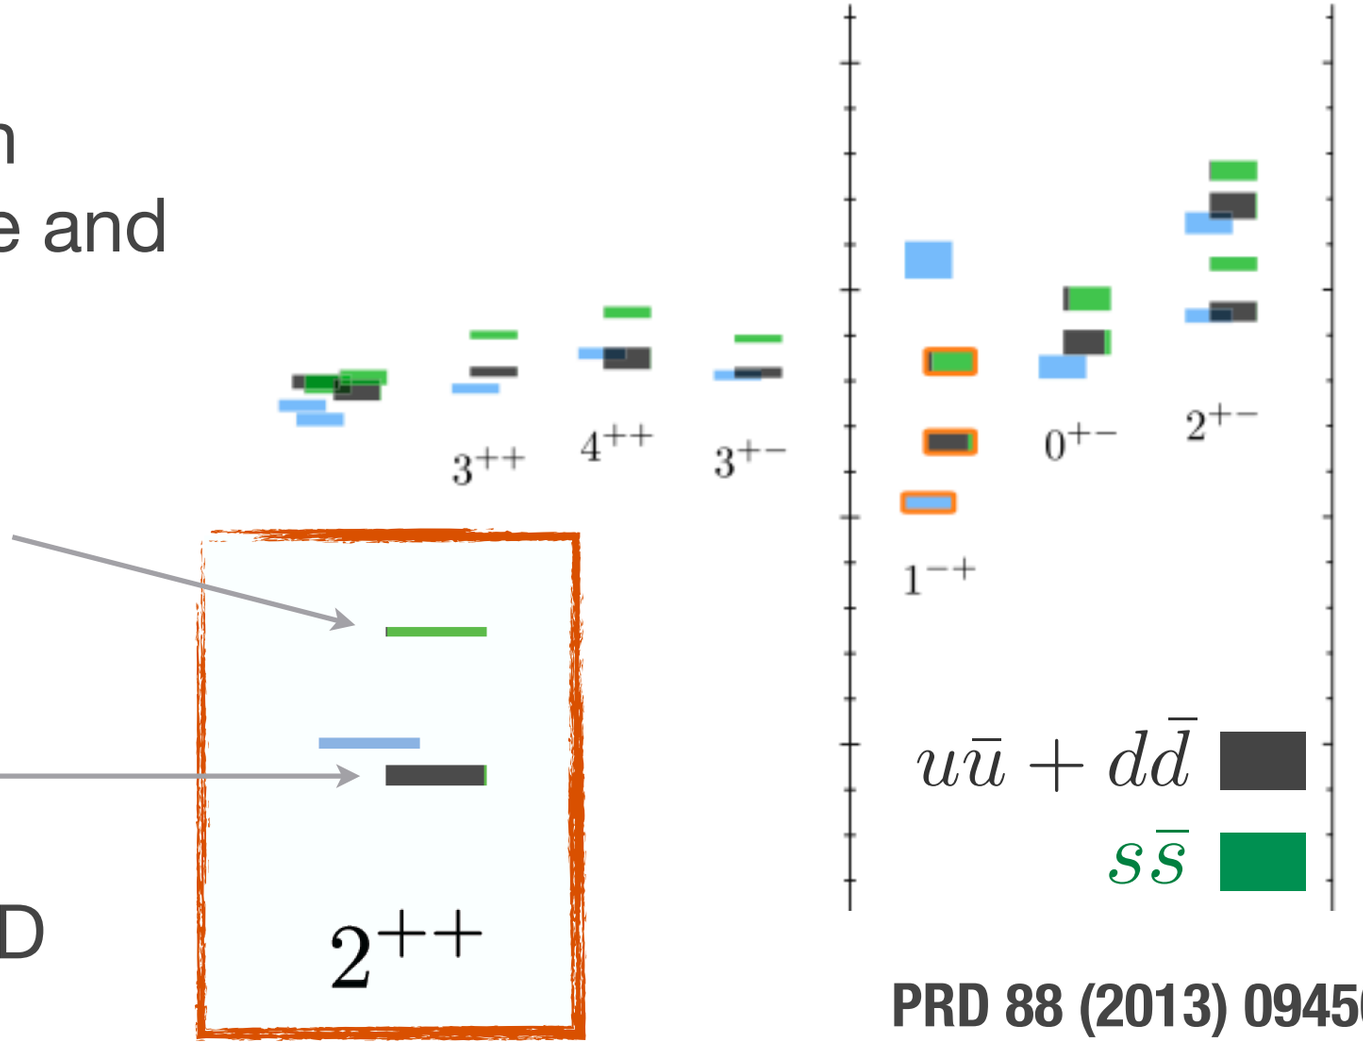
	Approximate Mass (MeV)	J^{PC}	Final States
π_1	1900	1^{-+}	$\omega\pi\pi^\dagger$, $3\pi^\dagger$, 5π, $\eta 3\pi^\dagger$, $\eta'\pi^\dagger$
η_1	2100	1^{-+}	4π, $\eta 4\pi$, $\eta\eta\pi\pi^\dagger$
η_1'	2300	1^{-+}	$KK\pi\pi^\dagger$, $KK\pi^\dagger$, $KK\omega^\dagger$

Strangeness program: decay patterns

- Experimentally infer quark flavor composition through branching ratios to strange and non-strange decays

$$\frac{\mathcal{B}(f_2'(1525) \to \pi\pi)}{\mathcal{B}(f_2'(1525) \to KK)} \approx 0.009$$

$$\frac{\mathcal{B}(f_2(1270) \to \pi\pi)}{\mathcal{B}(f_2(1270) \to KK)} \approx 20$$

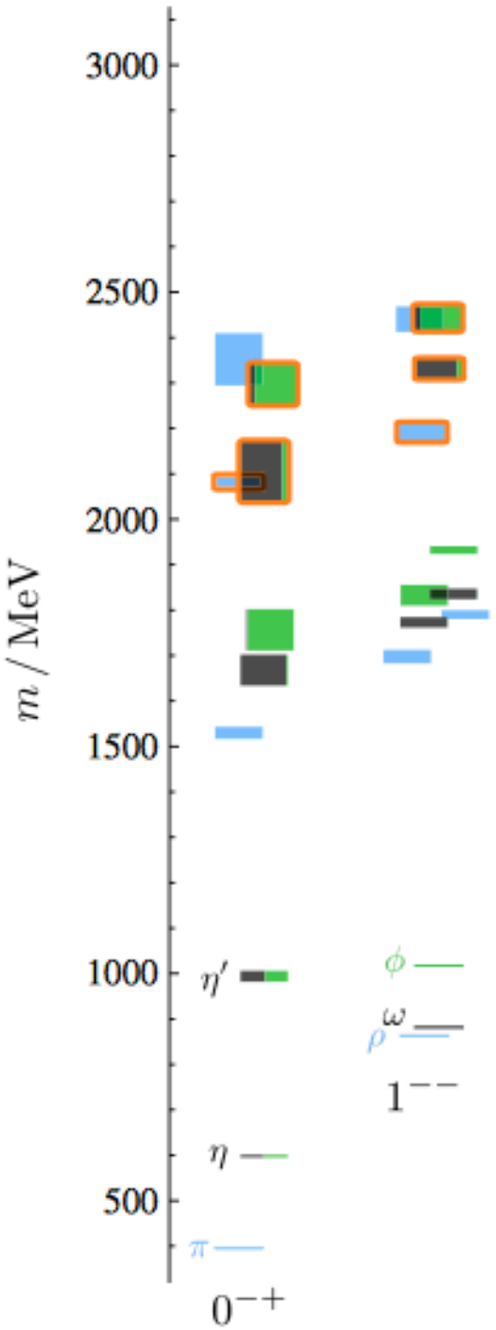


- Consistent with lattice QCD mixing angle for 2^{++}, and predictions for hybrids

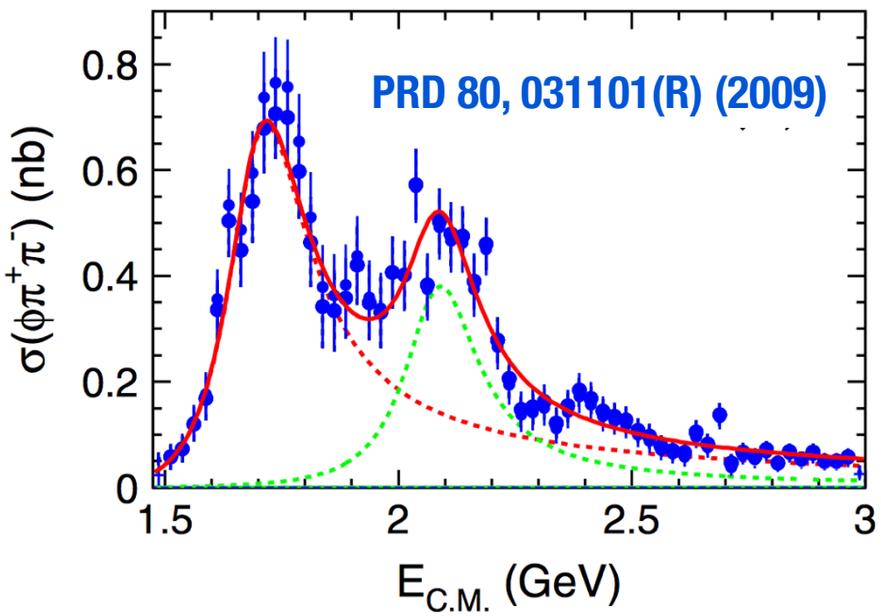
- Need capability to detect strange and non-strange to infer hybrid flavor content

PRD 88 (2013) 094505

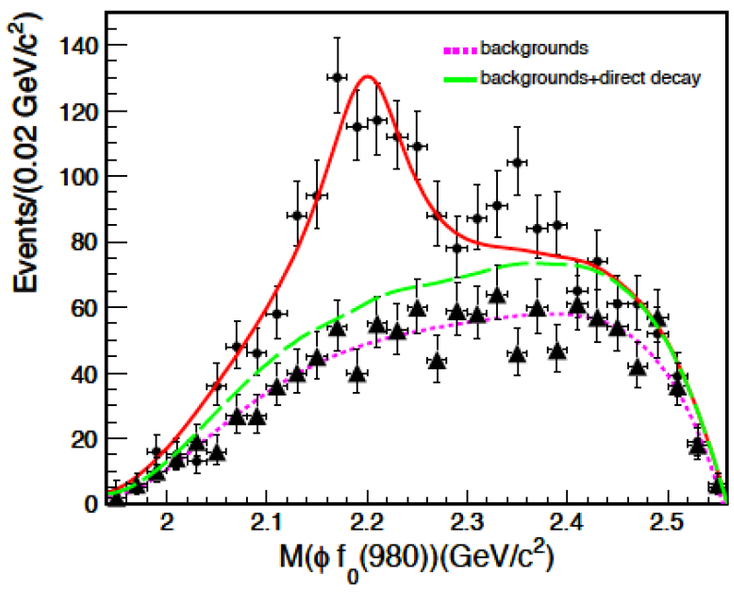
Strangeness program: Y(2175)



Belle: $e^+e^- \to \phi\pi^+\pi^-(\gamma)$



BES III: $J/\psi \to \eta\phi\pi^+\pi^-$



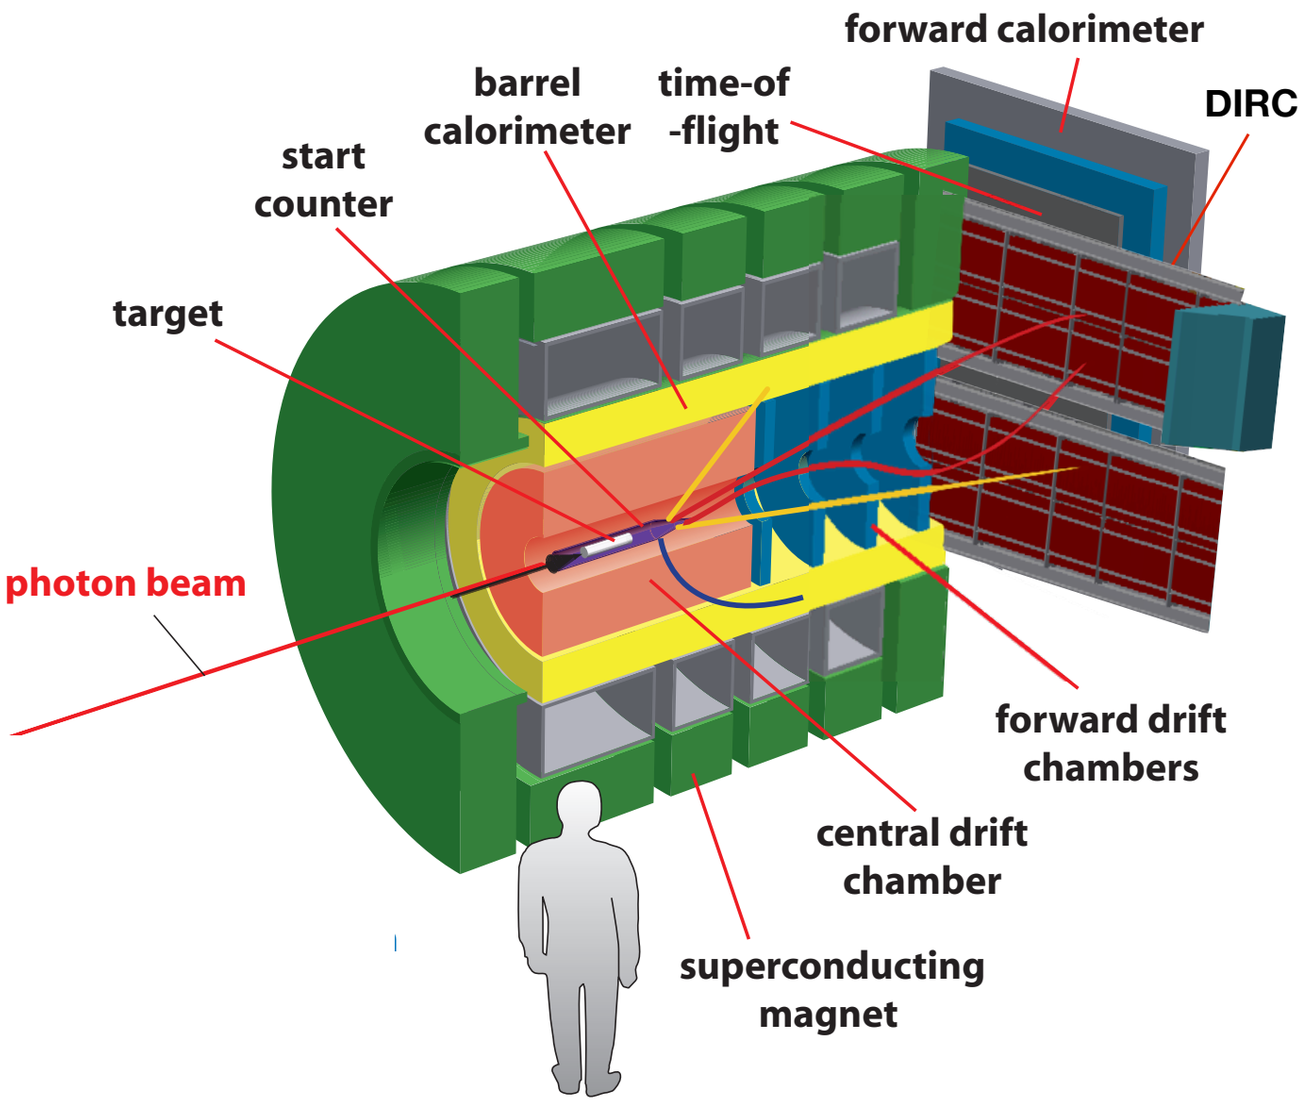
PRD 91, 052017 (2015)

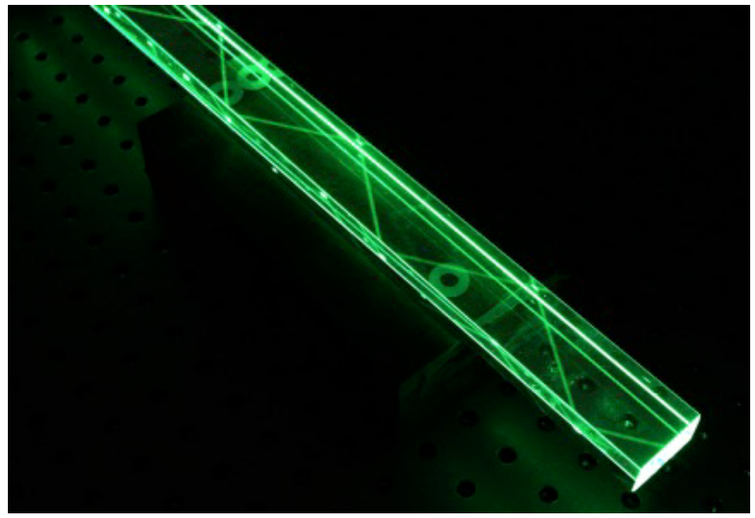
- Y(2175) $J^{PC}=1^{--}$ state observed by 3 experiments
- Decay pattern similar to Y(4260) in charmonium

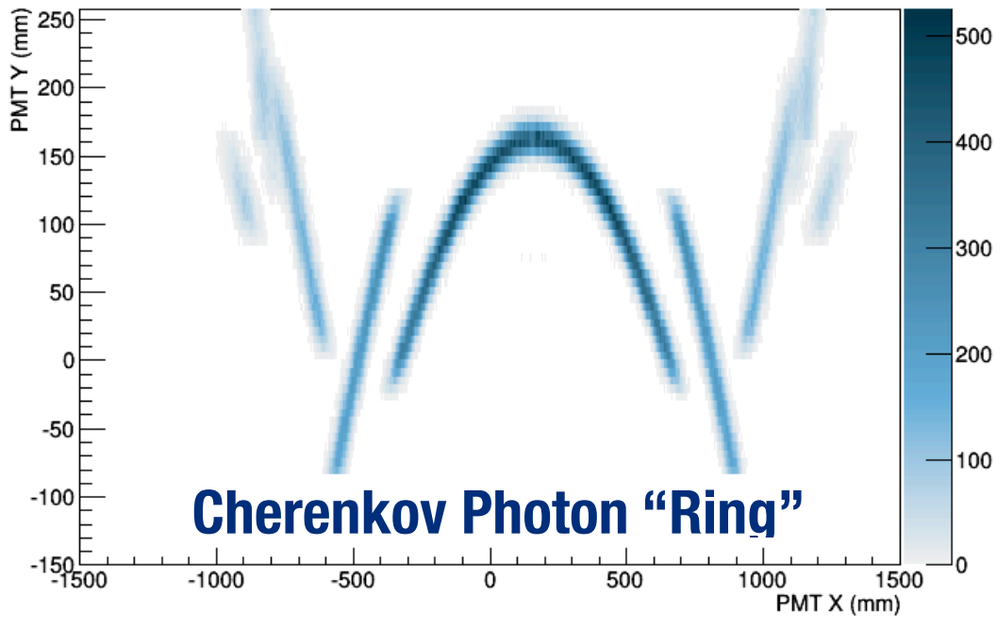
$$Y(2175) \to \phi\pi^+\pi^- \qquad Y(4260) \to J/\psi\pi^+\pi^-$$

- Is there evidence for such strangeonium states in photoproduction?

GlueX DIRC upgrade



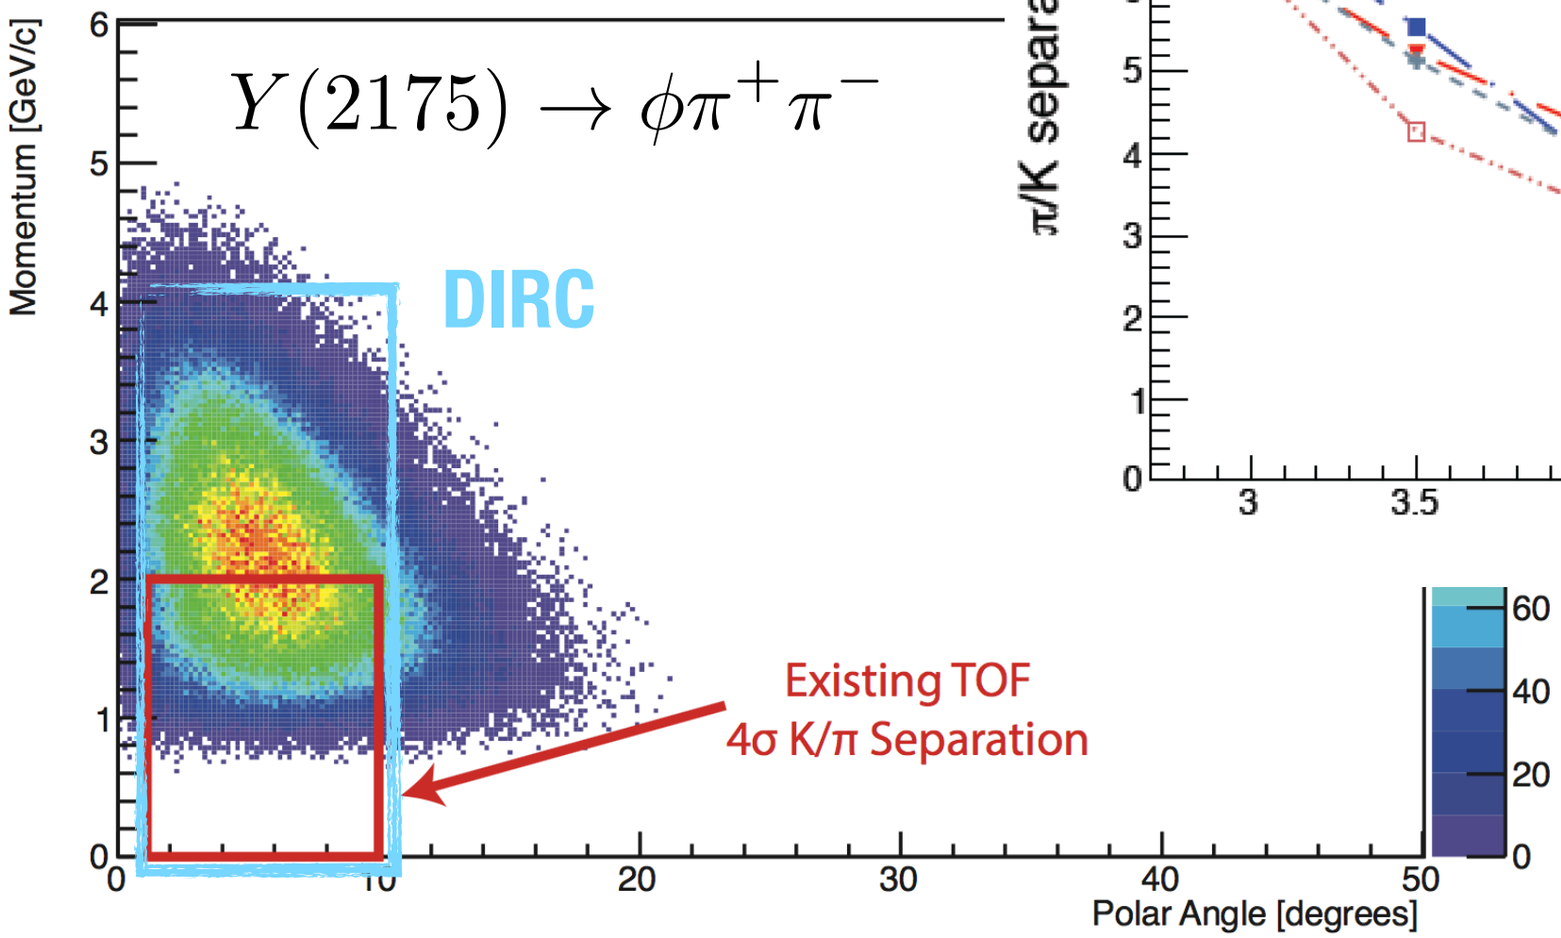


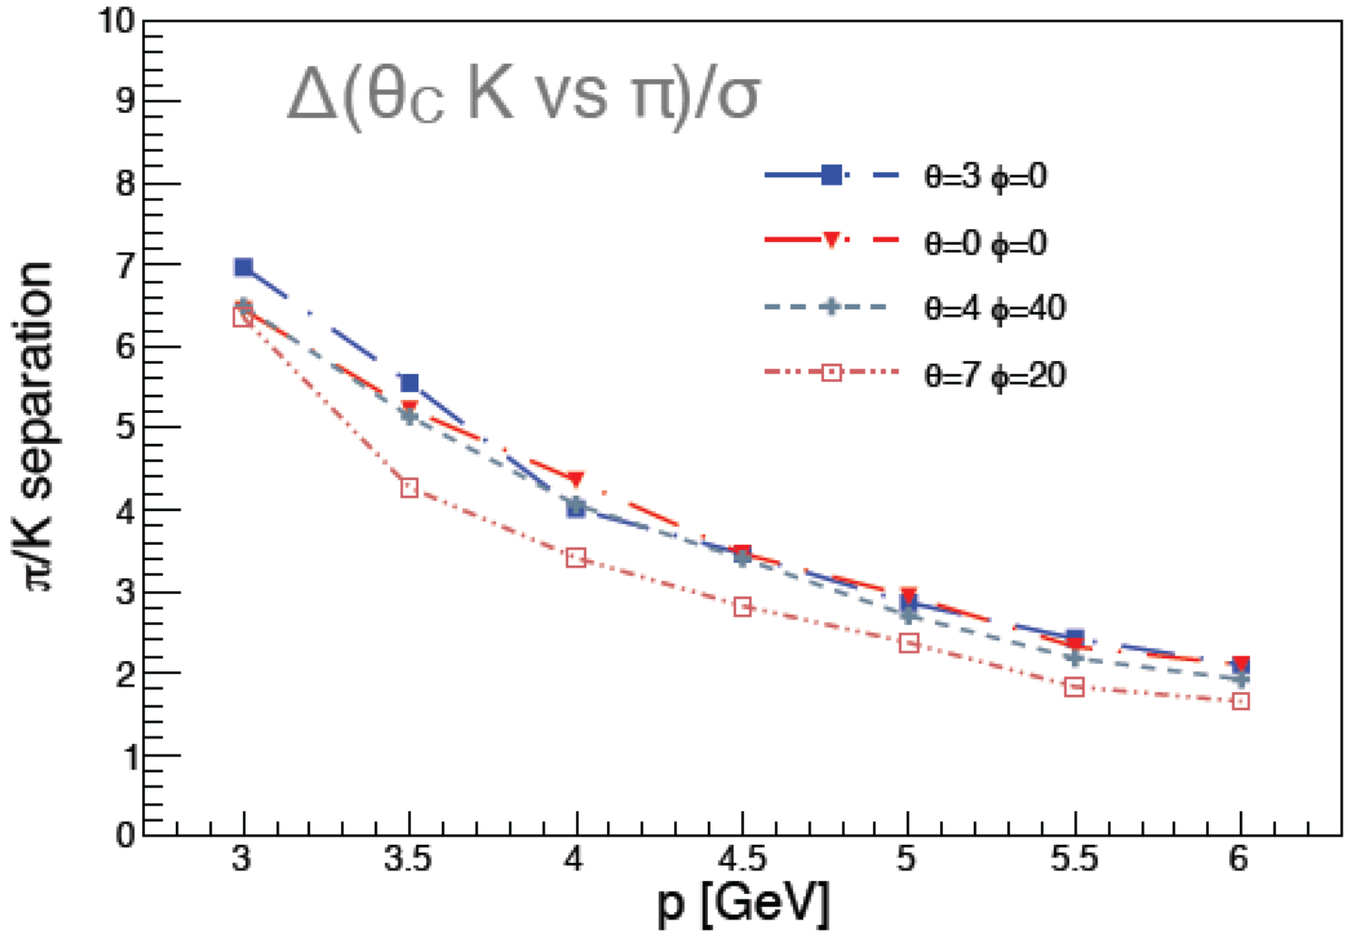


- The GlueX **DIRC** (**D**etection of **I**nternally **R**eflected **C**herenkov light) provides new K/π separation and will use components of the BaBar DIRC
- Partial installation and commissioning in **2018**

Expected DIRC performance

GlueX **Simulation**





- Significantly extends reach in search for exotic hadrons (hybrid, multi-quark, etc.) containing strange quarks

Summary

- The GlueX experiment is commissioned and the initial meson program is well underway
- First results aim at understanding the meson photoproduction mechanism through beam asymmetries and other polarization observables
- An upgrade is in progress to improve the identification of charged kaons to enhance the strange meson spectroscopy program

Exotic J^{PC} decays

C. A. Meyer and E. S. Swanson,
Progress in Particle and Nuclear Physics B82, 21, (2015)

	Approximate Mass (MeV)	J^{PC}	Total Width MeV PSS	IKP	Allowed Decay Modes
π_1	1900	1^{-+}	81 – 168	117	$b_1\pi$, $\pi\rho$, πf_1, $\pi\eta$, $\pi\eta'$, ηa_1, $\pi\eta(1295)$
η_1	2100	1^{-+}	59 – 158	107	πa_1, πa_2, ηf_1 ηf_2, $\pi\pi(1300)$, $\eta\eta'$, KK_1^A, KK_1^B
η_1'	2300	1^{-+}	95 – 216	172	KK_1^B, KK_1^A, KK^* $\eta\eta'$
b_0	2400	0^{+-}	247 – 429	665	$\pi\pi(1300)$, πh_1, ρf_1, ηb_1
h_0	2400	0^{+-}	59 – 262	94	πb_1, ηh_1, $KK(1460)$
h_0'	2500	0^{+-}	259 – 490	426	$KK(1460)$, KK_1^A, ηh_1
b_2	2500	2^{+-}	5 – 11	248	πa_1, πa_2, πh_1, $\eta\rho$, ηb_1, ρf_1
h_2	2500	2^{+-}	4 – 12	166	$\pi\rho$, πb_1, $\eta\omega$, ωb_1
h_2'	2600	2^{+-}	5 – 18	79	KK_1^B, KK_1^A, KK_2^*, ηh_1

- Predictions for the spectrum of hybrids from lattice, **but decay predictions are model dependent**

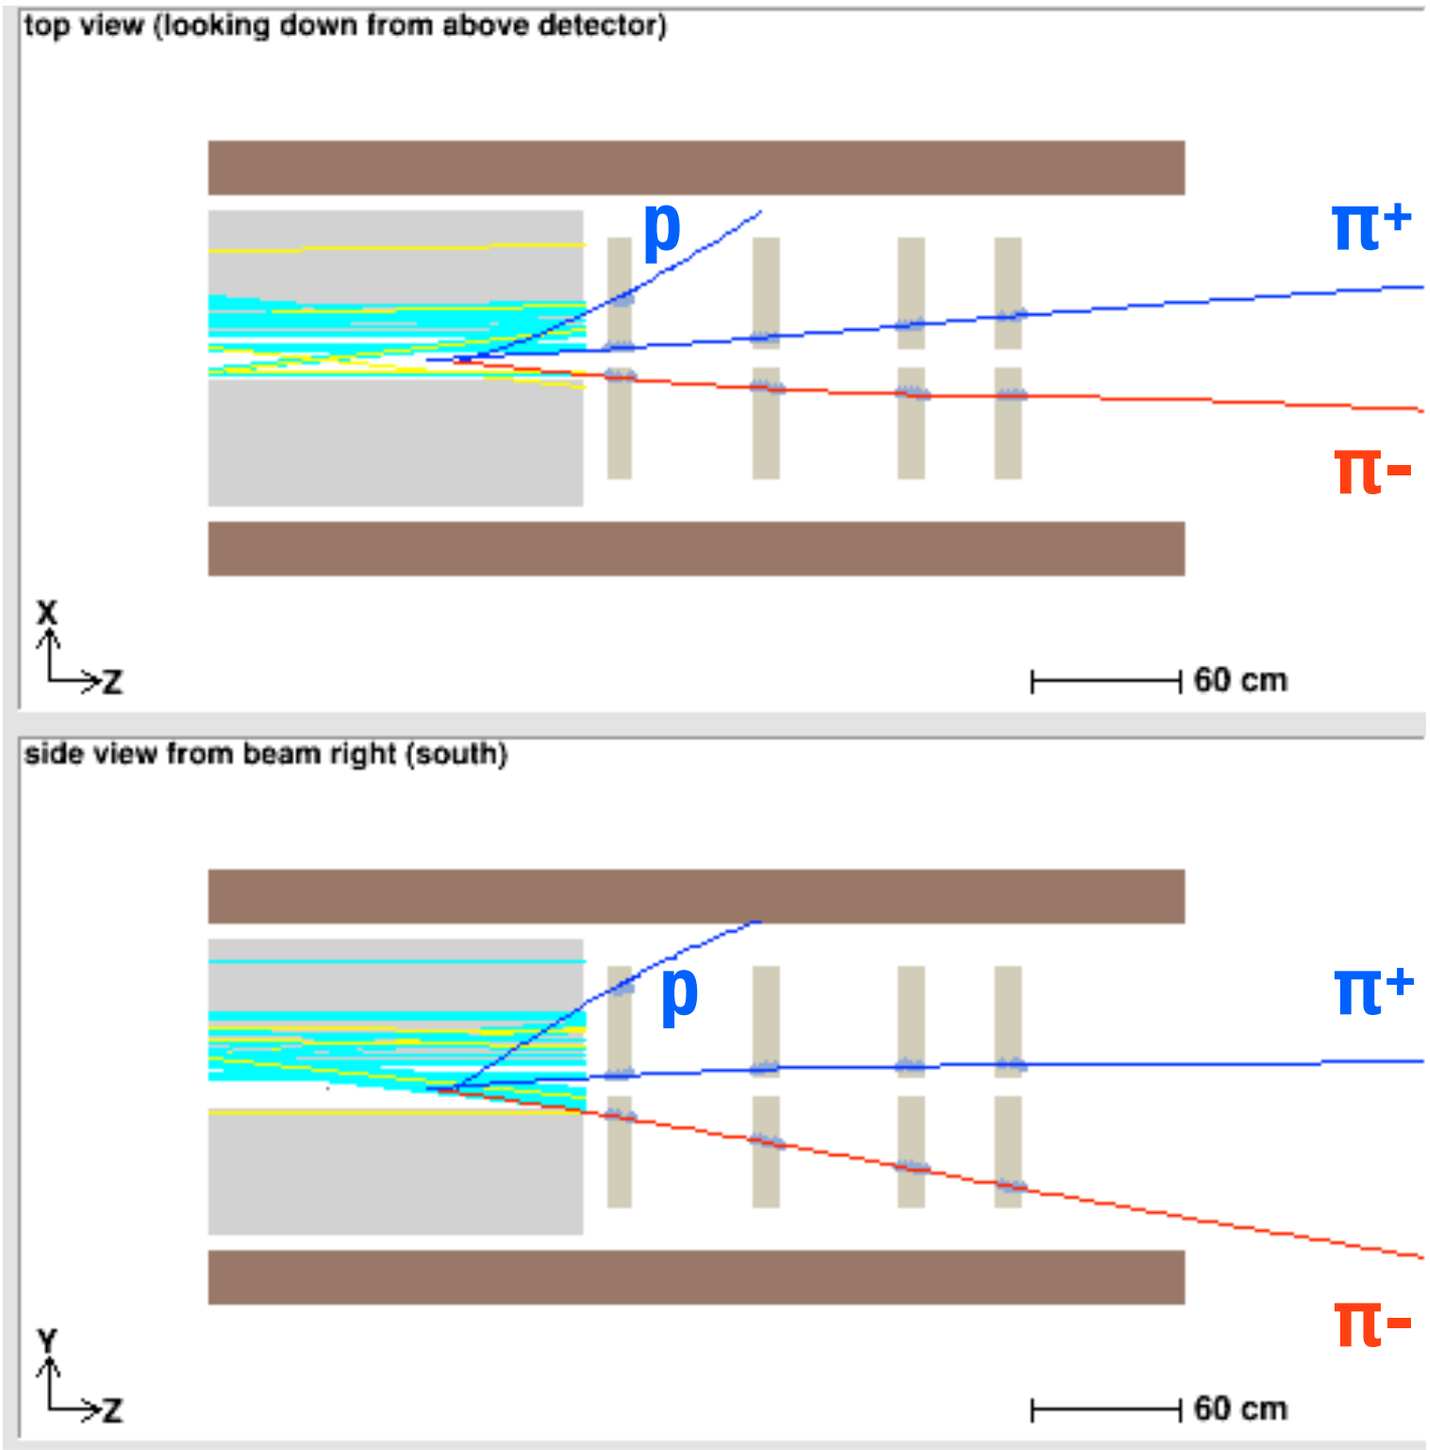
1^{-+} channels observed

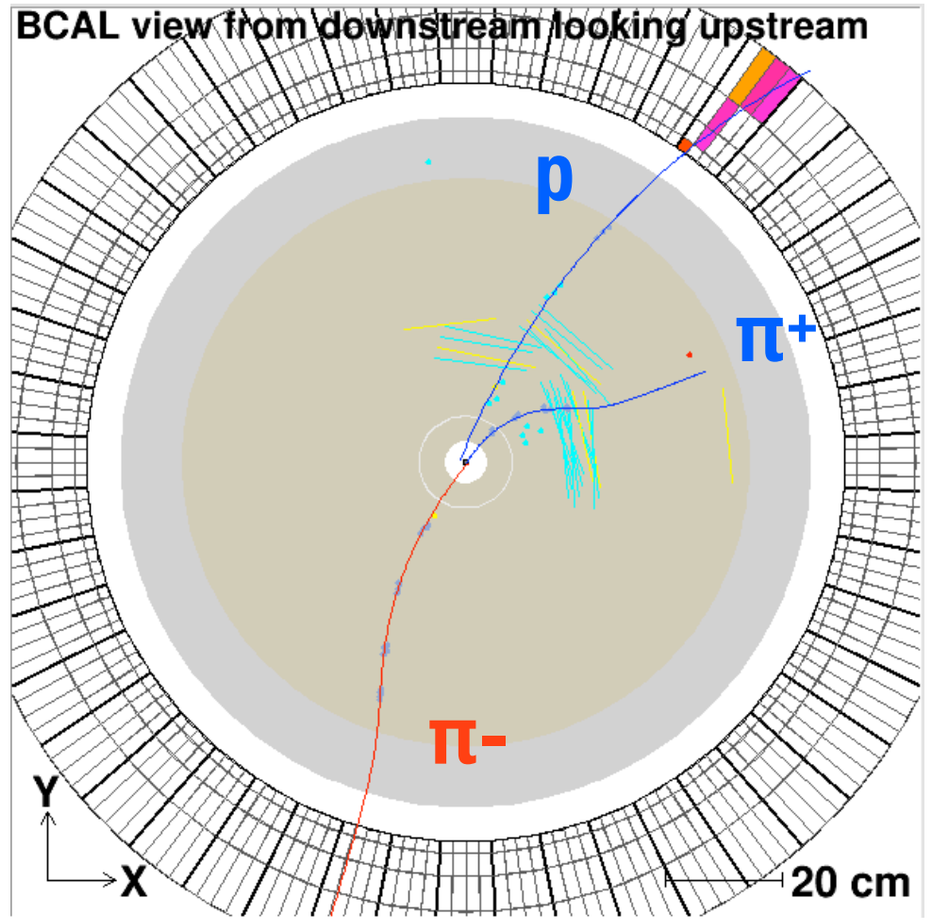
$$\pi\rho \to \pi\pi\pi$$
$$\pi\eta' \to \eta\pi\pi\pi$$
$$\pi b_1 \to \omega\pi\pi$$

Some additional 1^{-+} channels

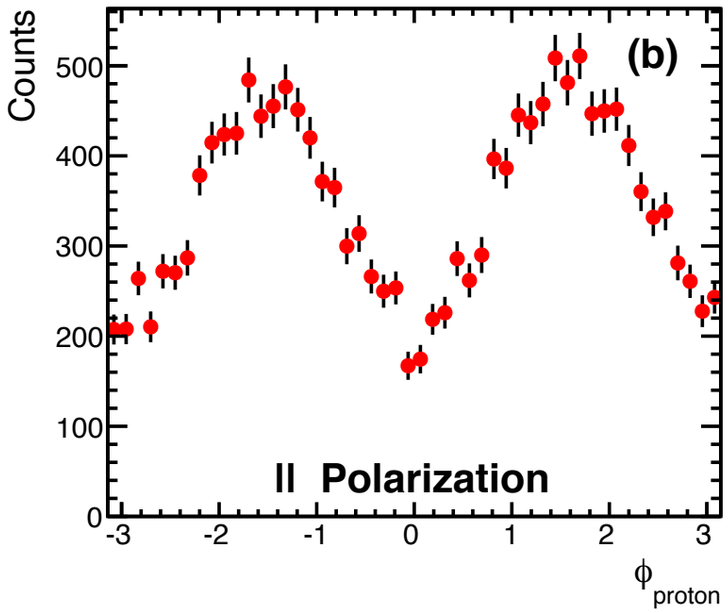
$$\pi a_2 \to \eta\pi\pi \qquad \eta f_1 \to \eta\eta\pi\pi$$
$$KK^* \to KK\pi$$
$$KK_1(1270) \to KK\pi\pi$$

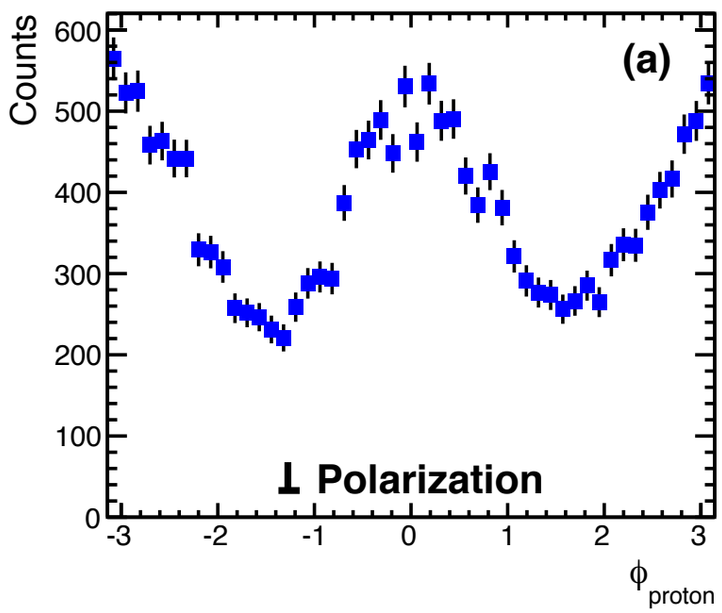
“Typical” γp→π⁺π⁻p event

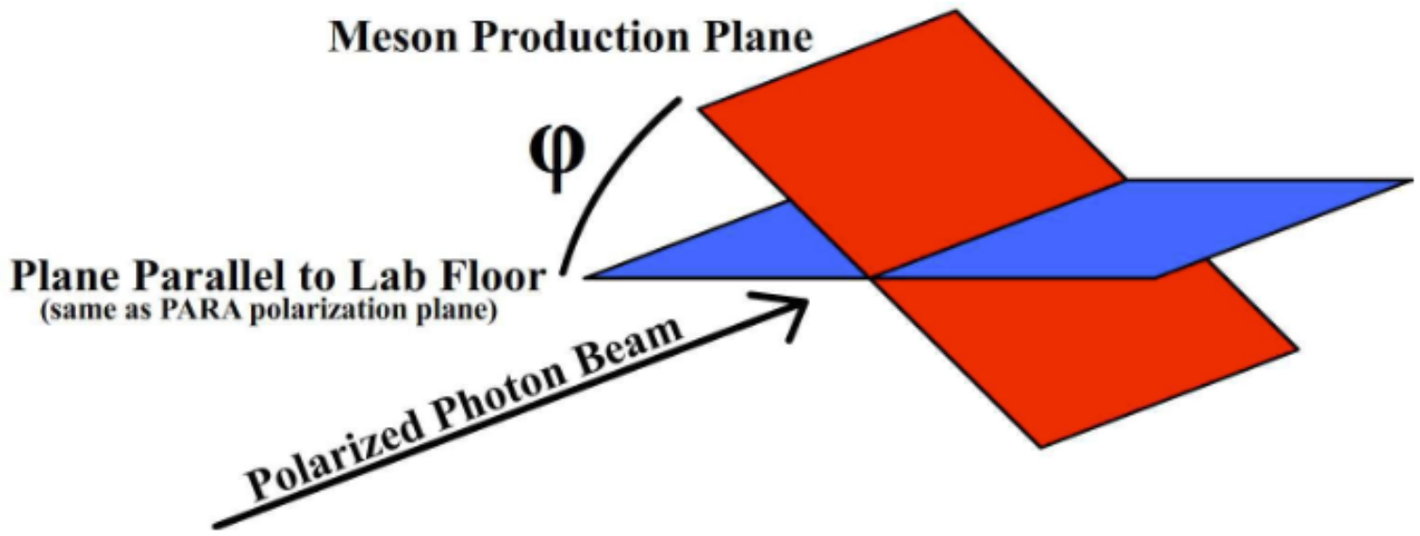




π^0 and η beam asymmetries



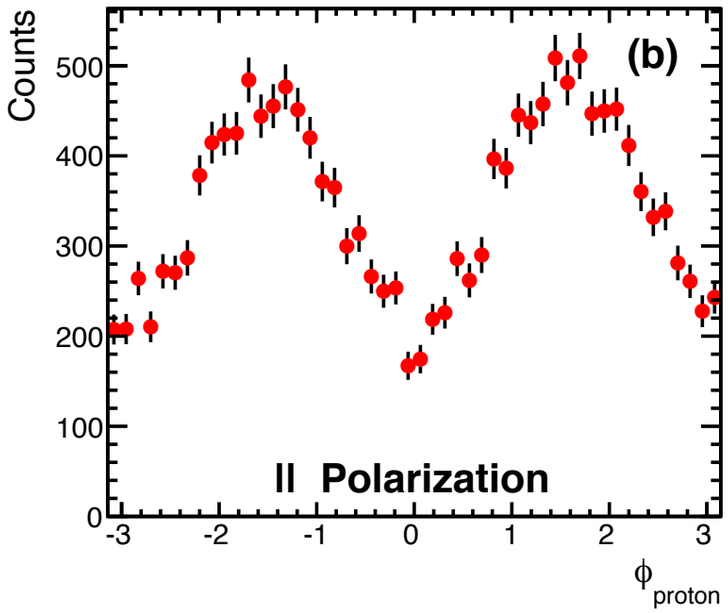


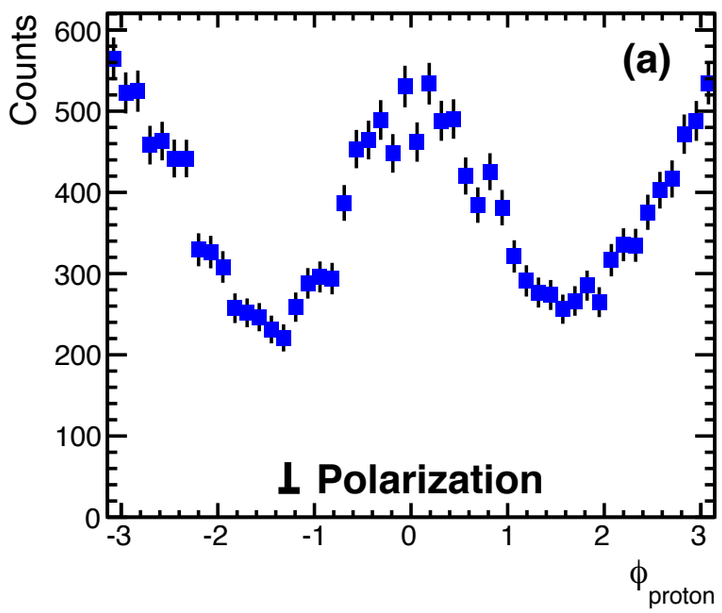


$$\sigma = \sigma_0 \left(1 - P_\gamma \Sigma \cos 2(\phi_p - \phi_\gamma^{\text{lin}})\right)$$

Phys. Rev. C 95, 042201(R)

π^0 and η beam asymmetries



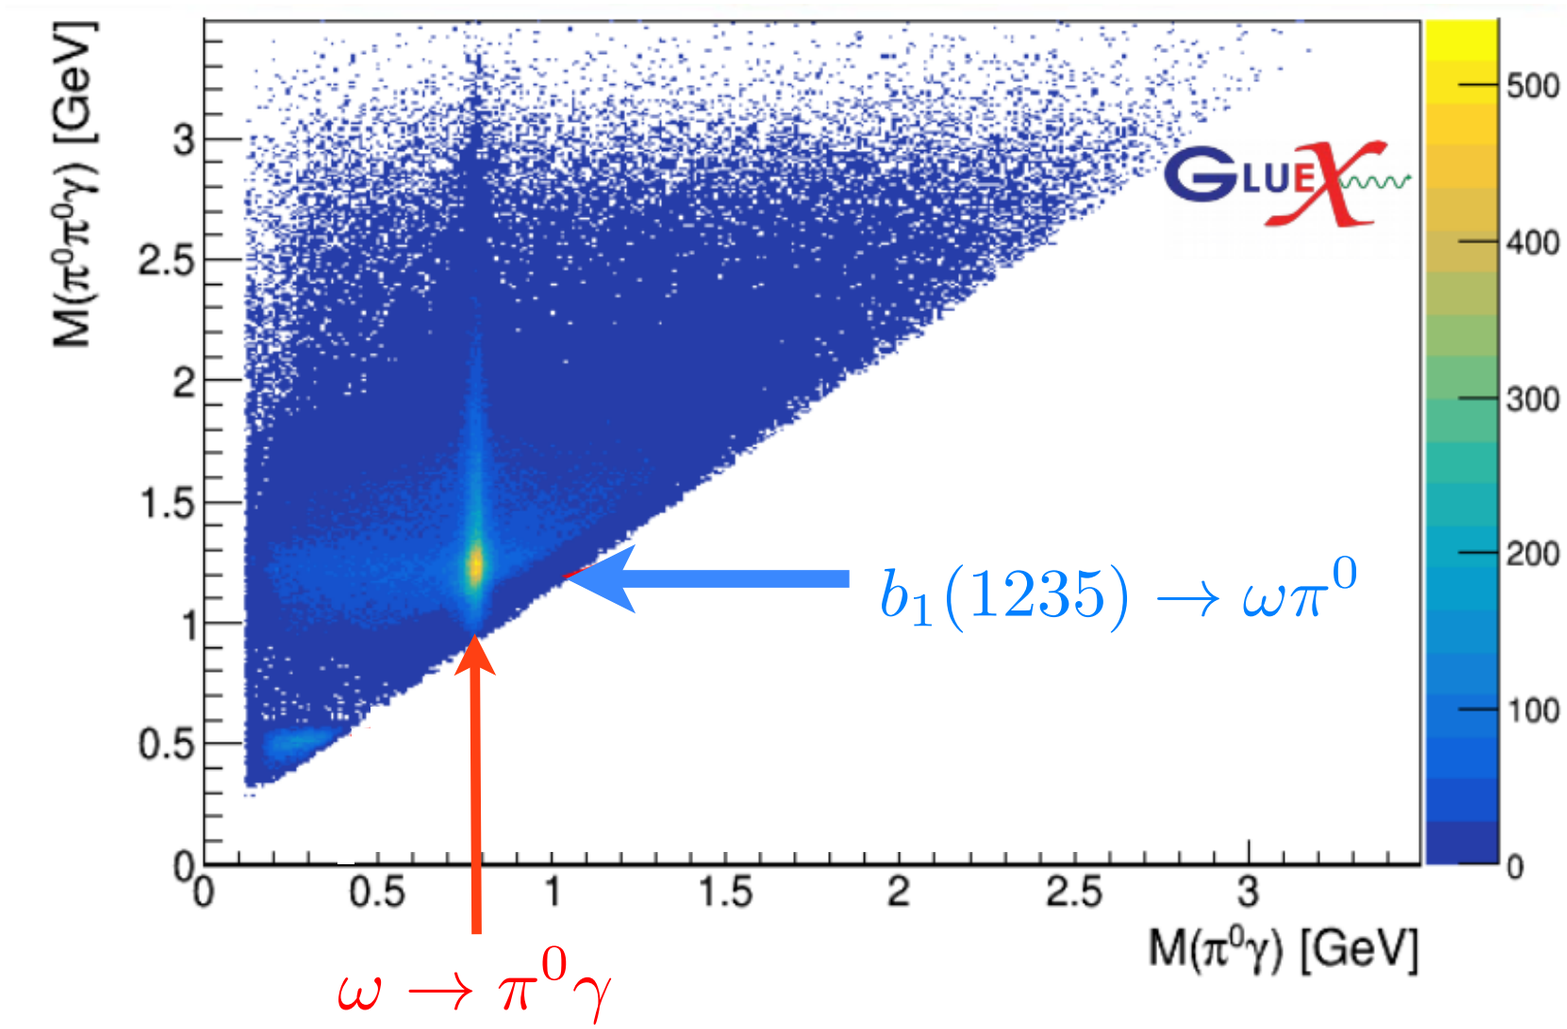


$$\frac{Y_\perp - F_R Y_\parallel}{Y_\perp + F_R Y_\parallel} = P_\gamma \Sigma \cos 2\phi_p$$

Phys. Rev. C 95, 042201(R)

Early spectroscopy opportunities

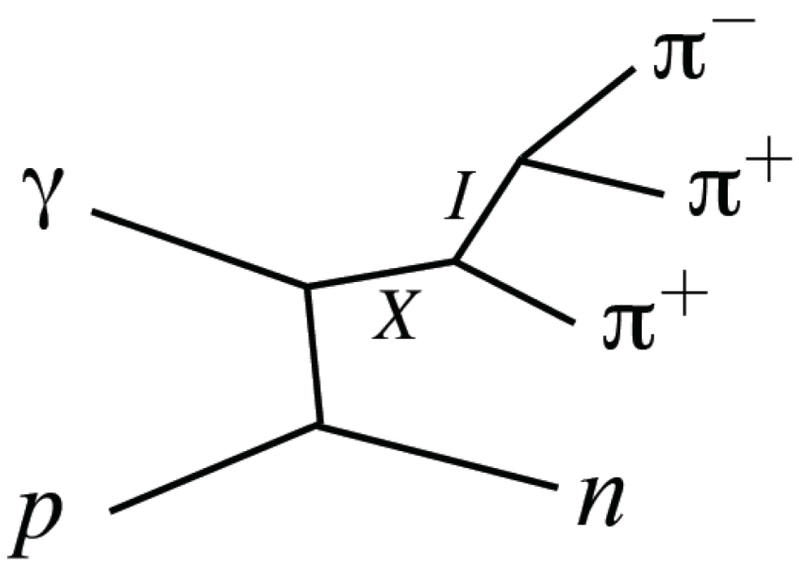
$$\gamma p \to 5\gamma p$$



$$\gamma p \to b_1 p, b_1 \to \omega\pi^0, \omega \to \pi^0\gamma$$

- Successfully reconstructing 5γ final state and observe b_1 signal consistent with previous JLab photoproduction experiment (**RadPhi**)

Amplitude Analysis



- **Goal:** Identify J^{PC} of $X \longrightarrow \pi^+\pi^-\pi^+$
- Model the intensity of events at the level of QM amplitudes (allow for interference)

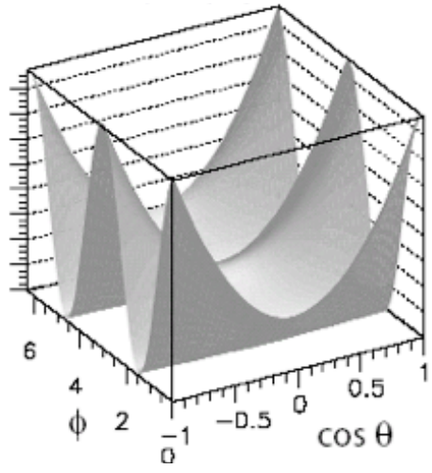
$$I(\vec{x}) = \frac{dN}{d\vec{x}} = \left| \sum_{\alpha}^{N_{\text{amps}}} V_\alpha A_\alpha(\vec{x}) \right|^2$$

- 5-dimensional problem: two new angles at each decay step (X and I)

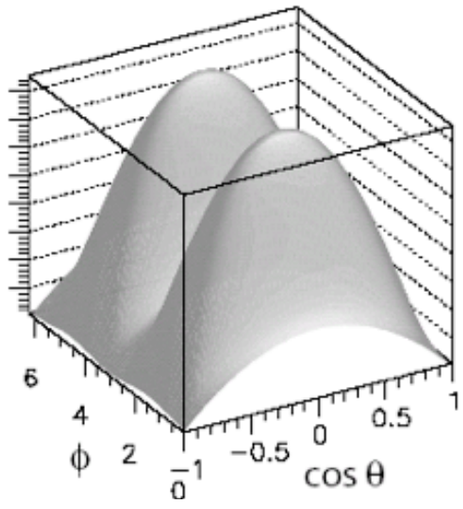
Example Intensity:

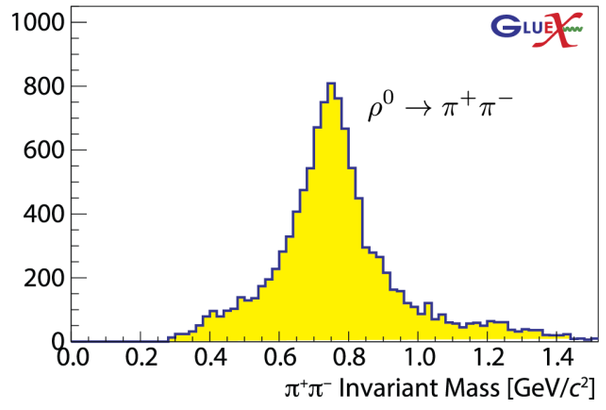
$$X(1^{++}) \rightarrow \rho\pi^+ \text{ (S wave)}$$

$X \rightarrow \rho\pi^+$



$\rho \rightarrow \pi^+\pi^-$





Amplitude Analysis

$$I(\vec{x}) = \frac{dN}{d\vec{x}} = \left| \sum_{\alpha}^{N_{\text{amps}}} V_\alpha A_\alpha(\vec{x}) \right|^2$$

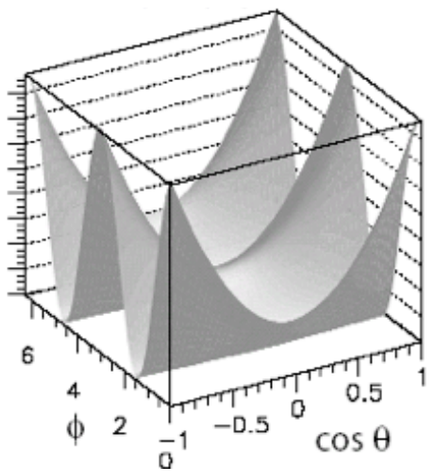
- Expand set of possible amplitudes over many X and I, and determine V_α via maximum likelihood fit
- Good angular acceptance critical for disentangling J^{PC}

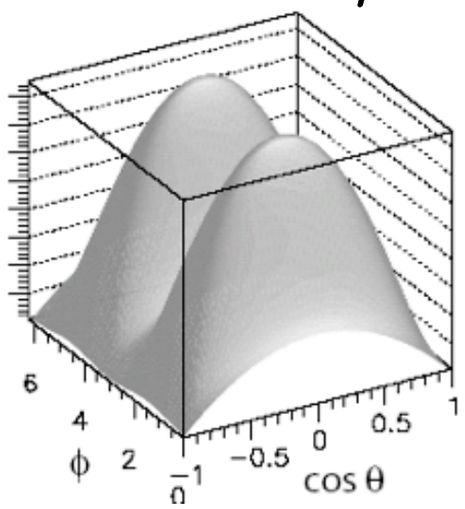
Example Intensities:

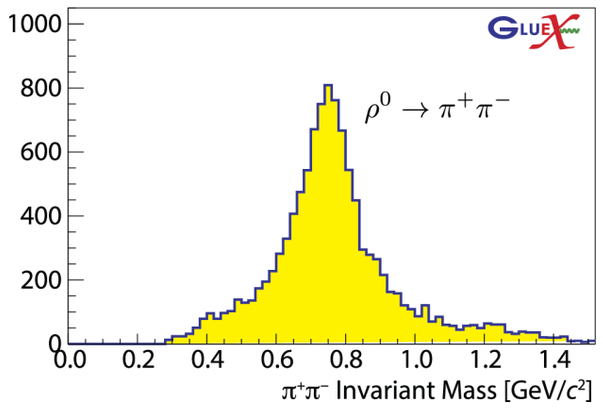
$X \to \rho\pi^+$

$\rho \to \pi^+\pi^-$

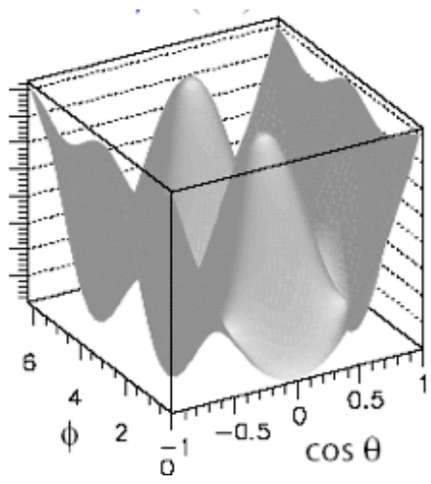
$X(1^{++})$
$\to \rho\pi^+$ (S wave)

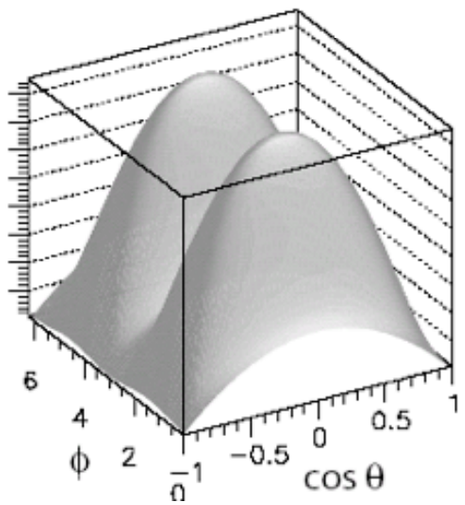


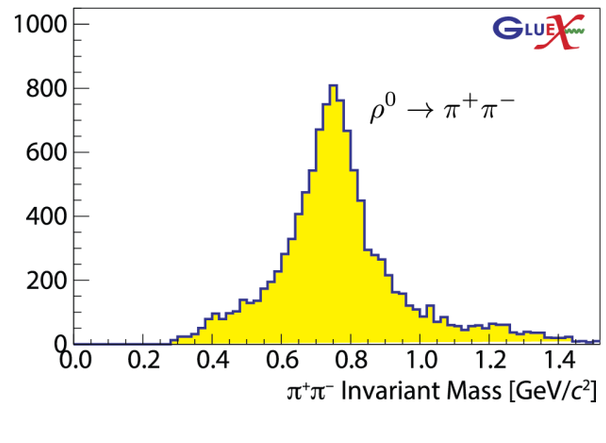




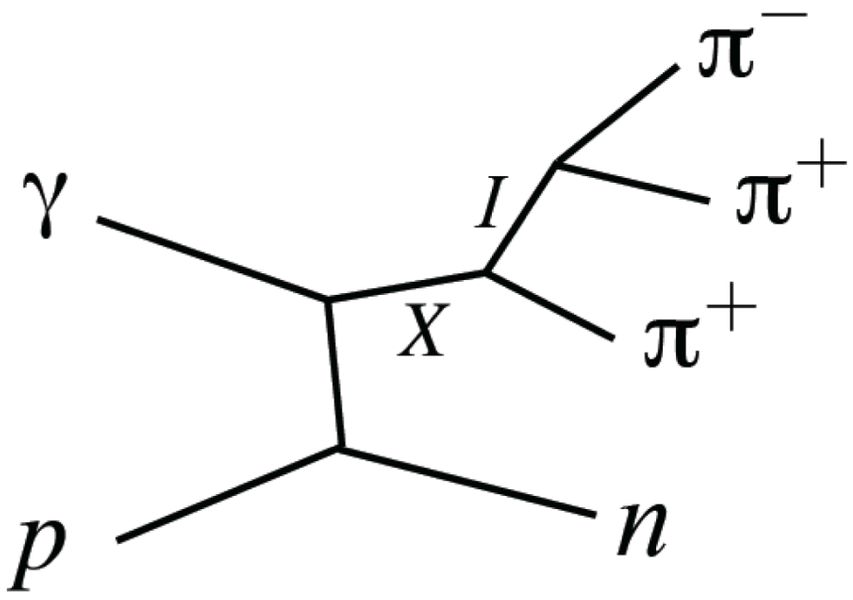
$X(2^{++})$
$\to \rho\pi^+$ (D wave)





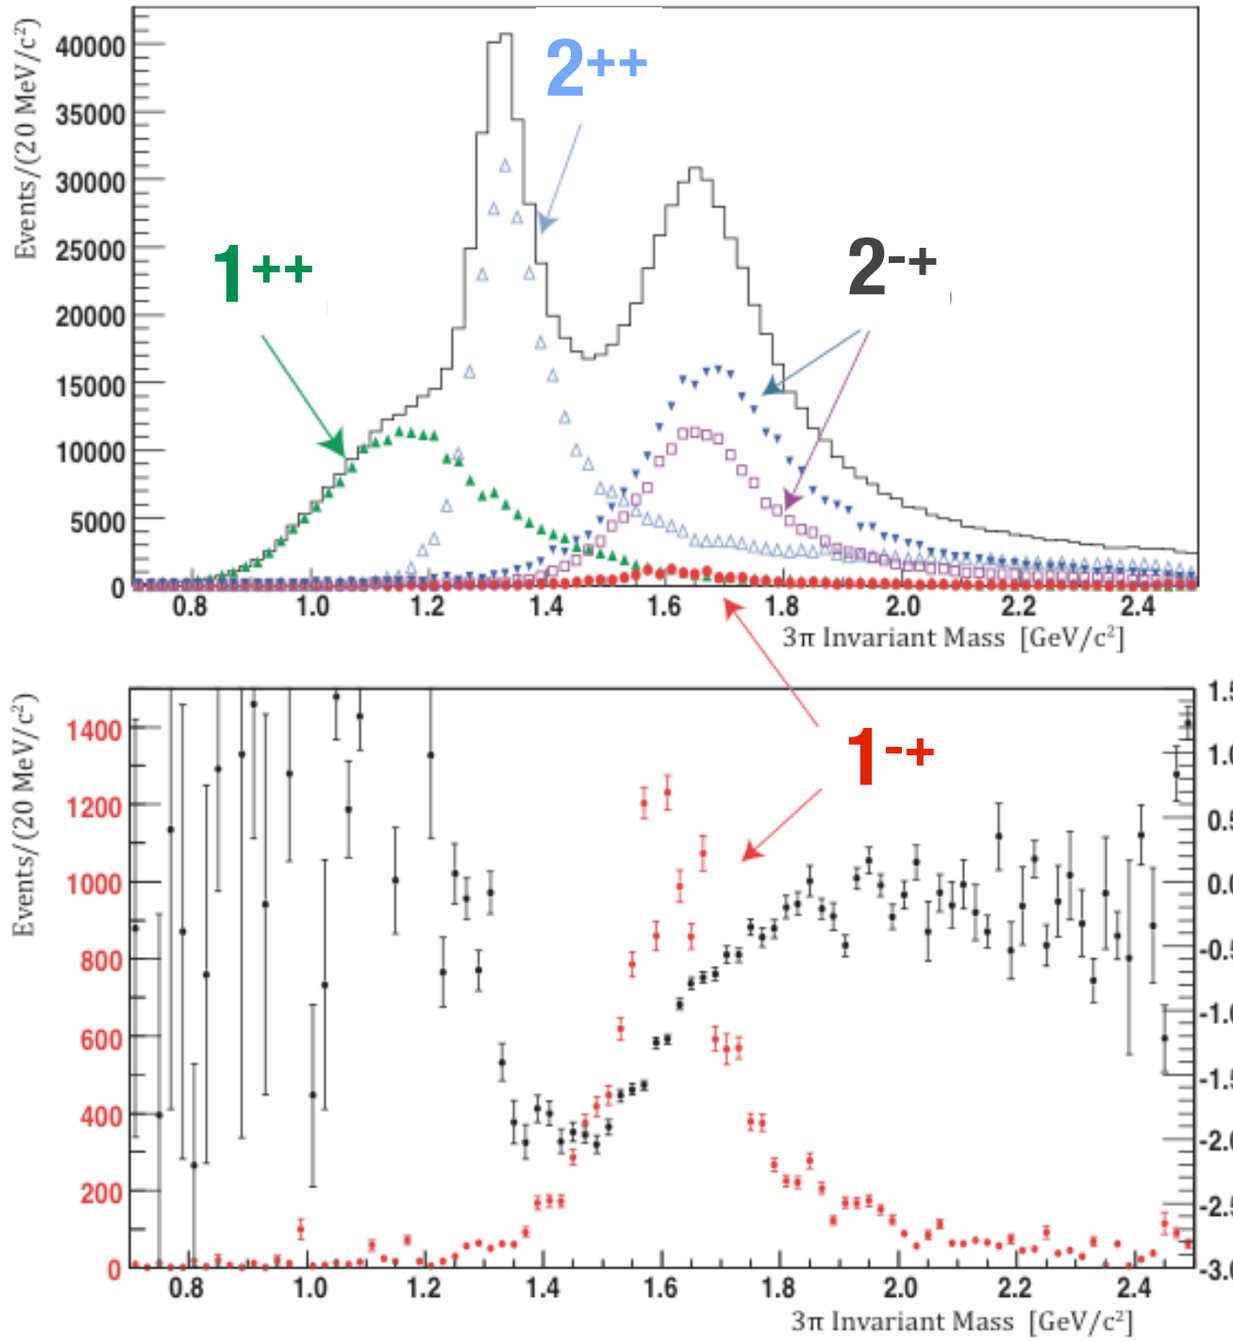


Amplitude Analysis



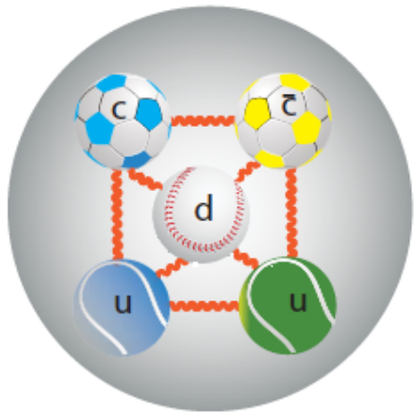
- **Simulate** production of known resonances and **exotic hybrid (1^{-+}) signal** with 1.6% relative strength
- Yields correspond to **~3.5 hours** of GlueX data taking (at full intensity)

GlueX Simulation

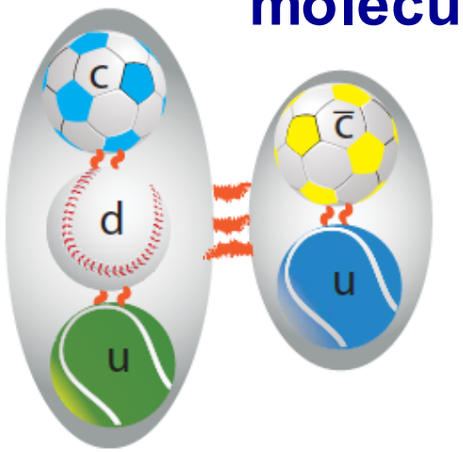


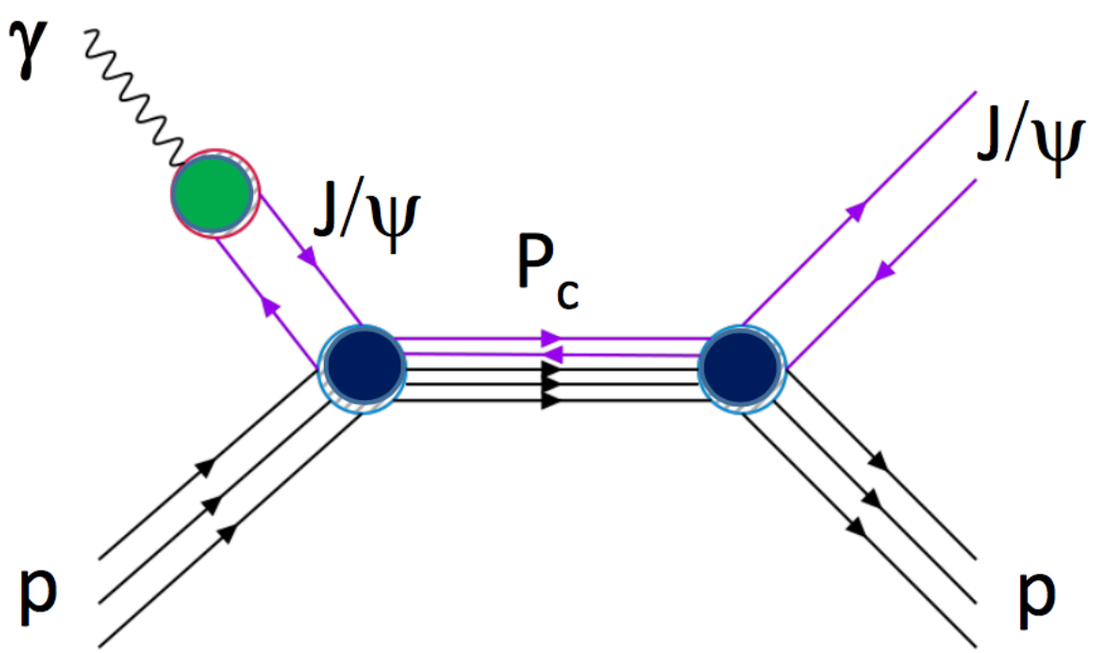
Charm Quarks at JLab

5-quark bound state

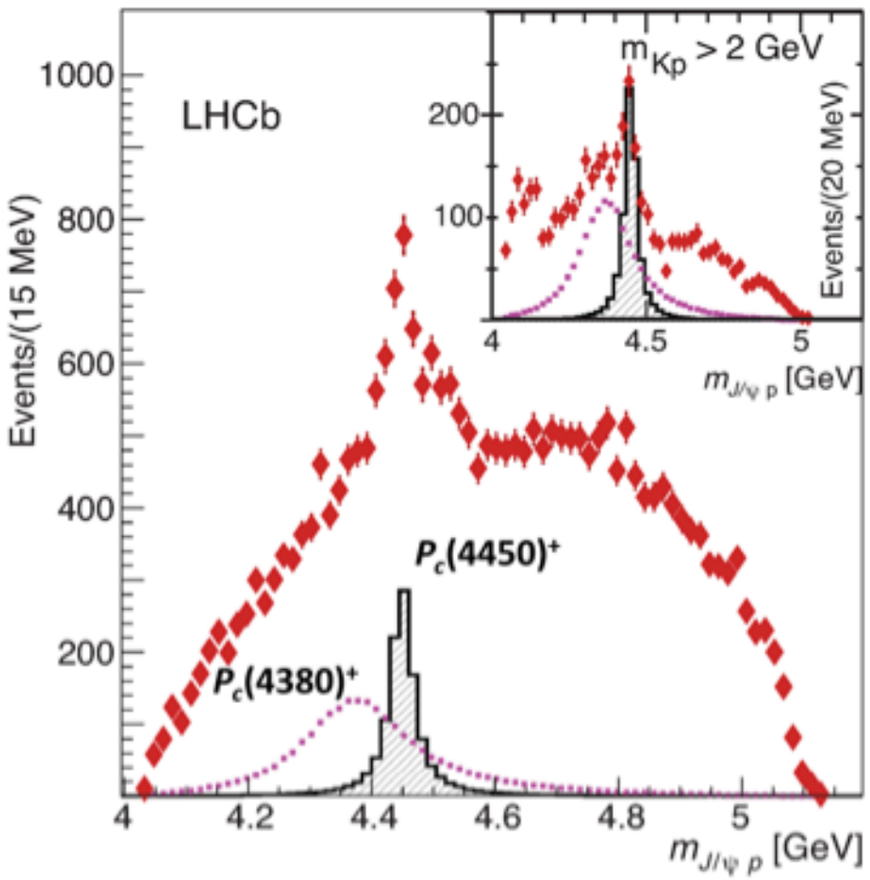


Hadronic molecule





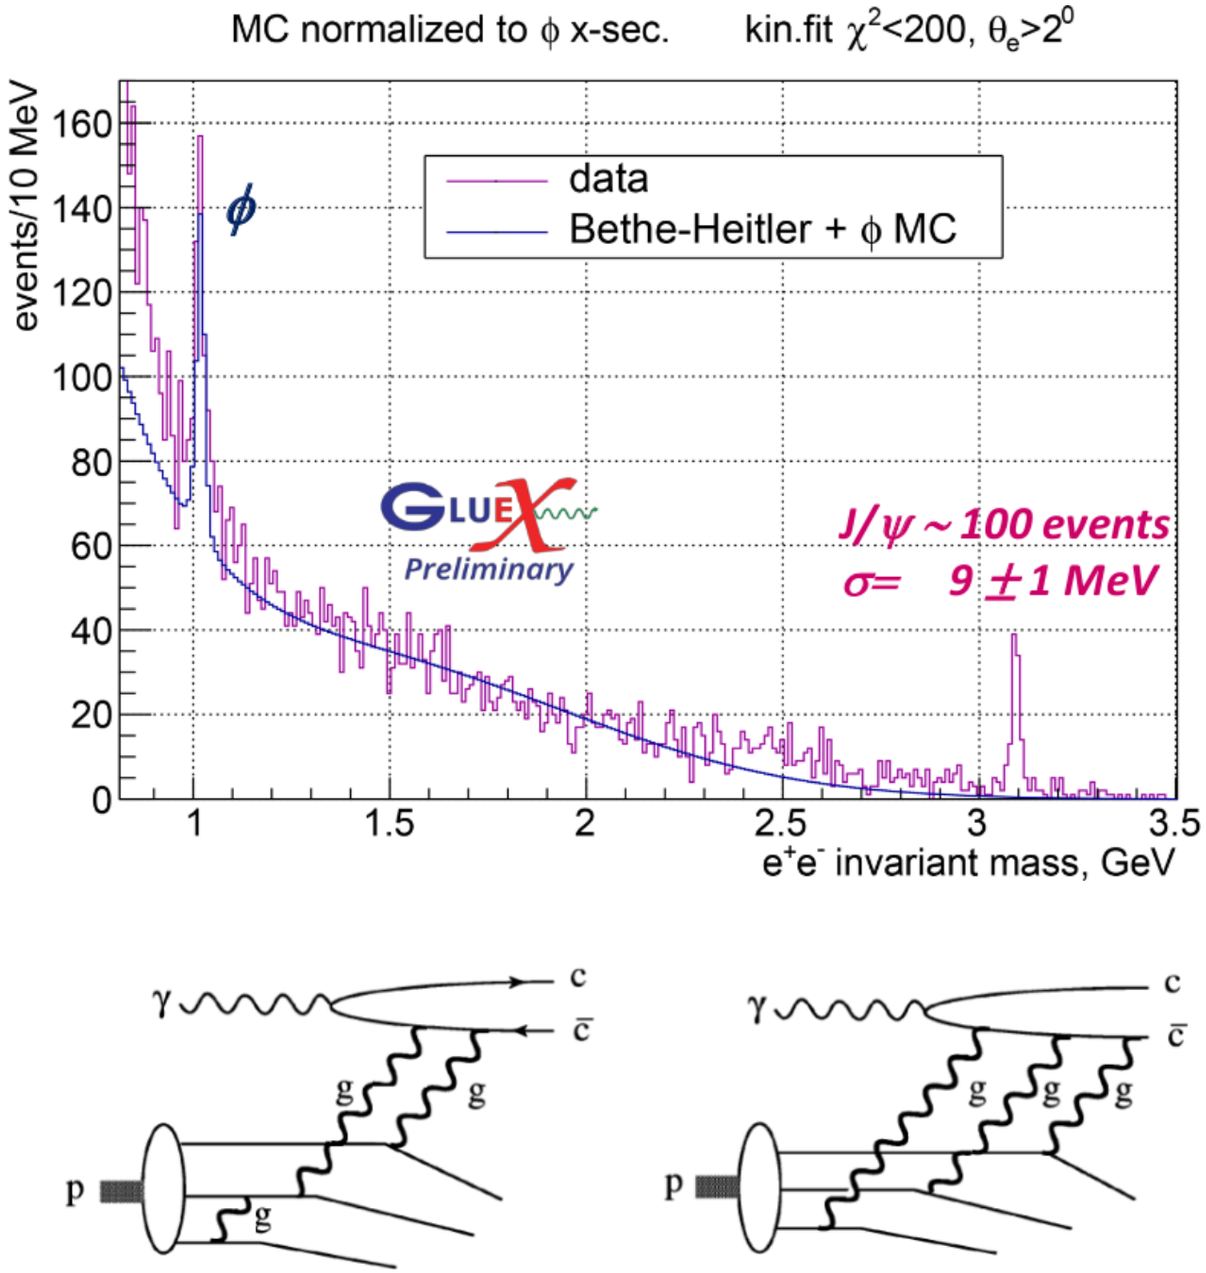
$$\Lambda_b \to J/\psi p K^-$$

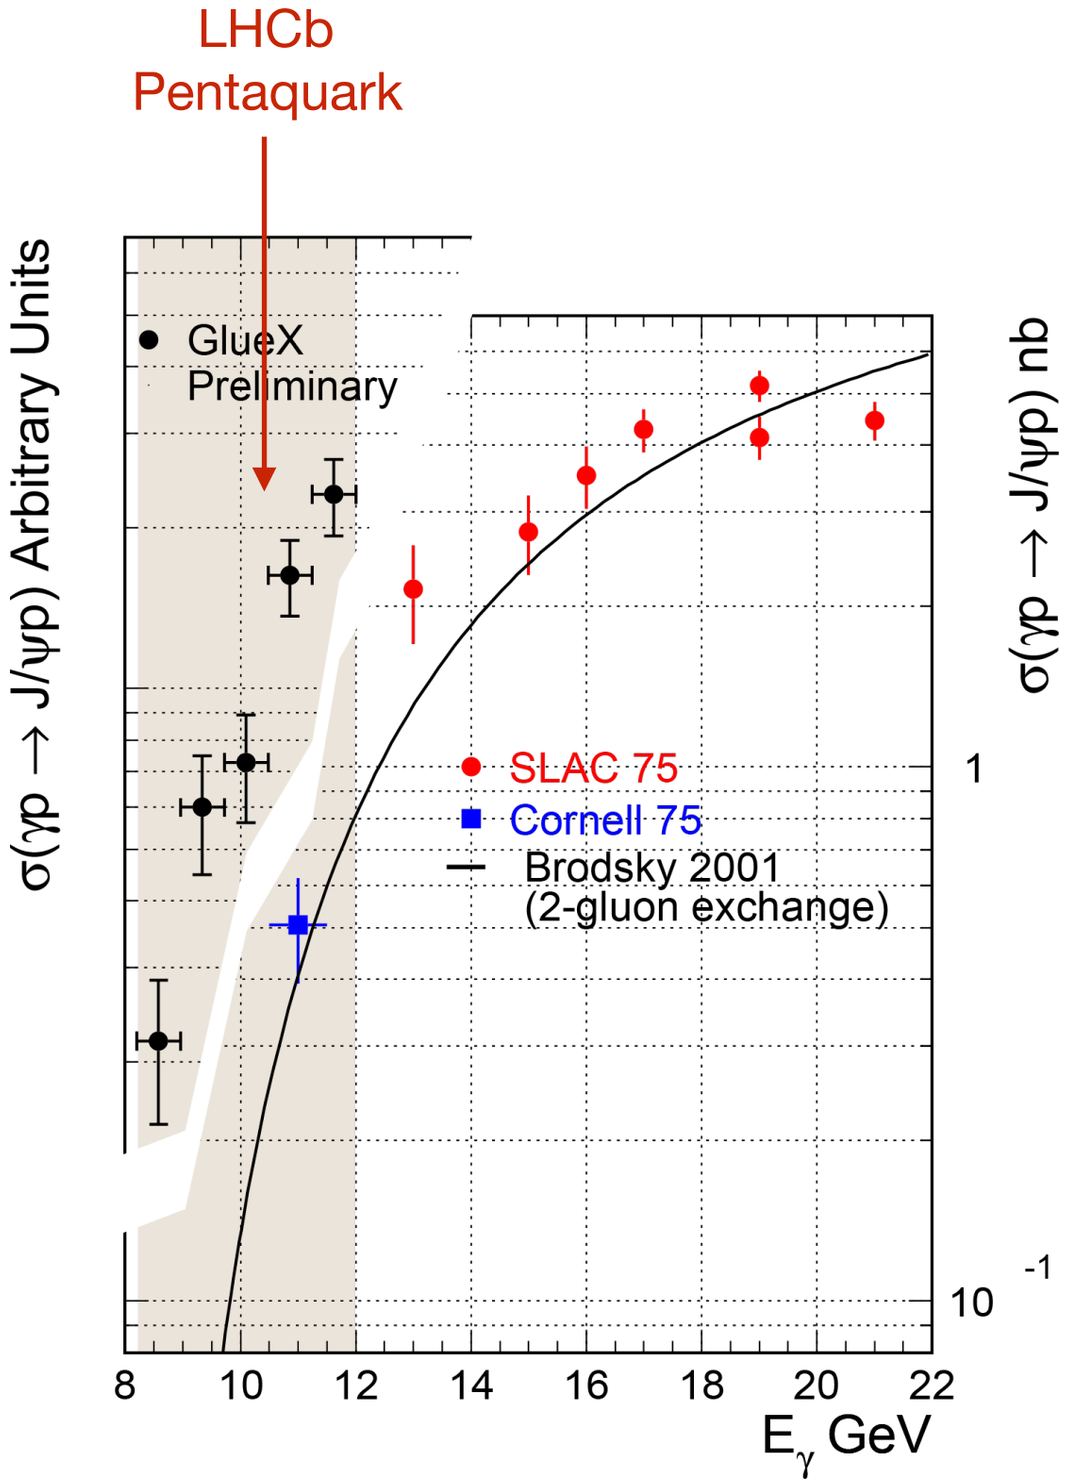


LHCb 2015

J/ψ photoproduction at GlueX

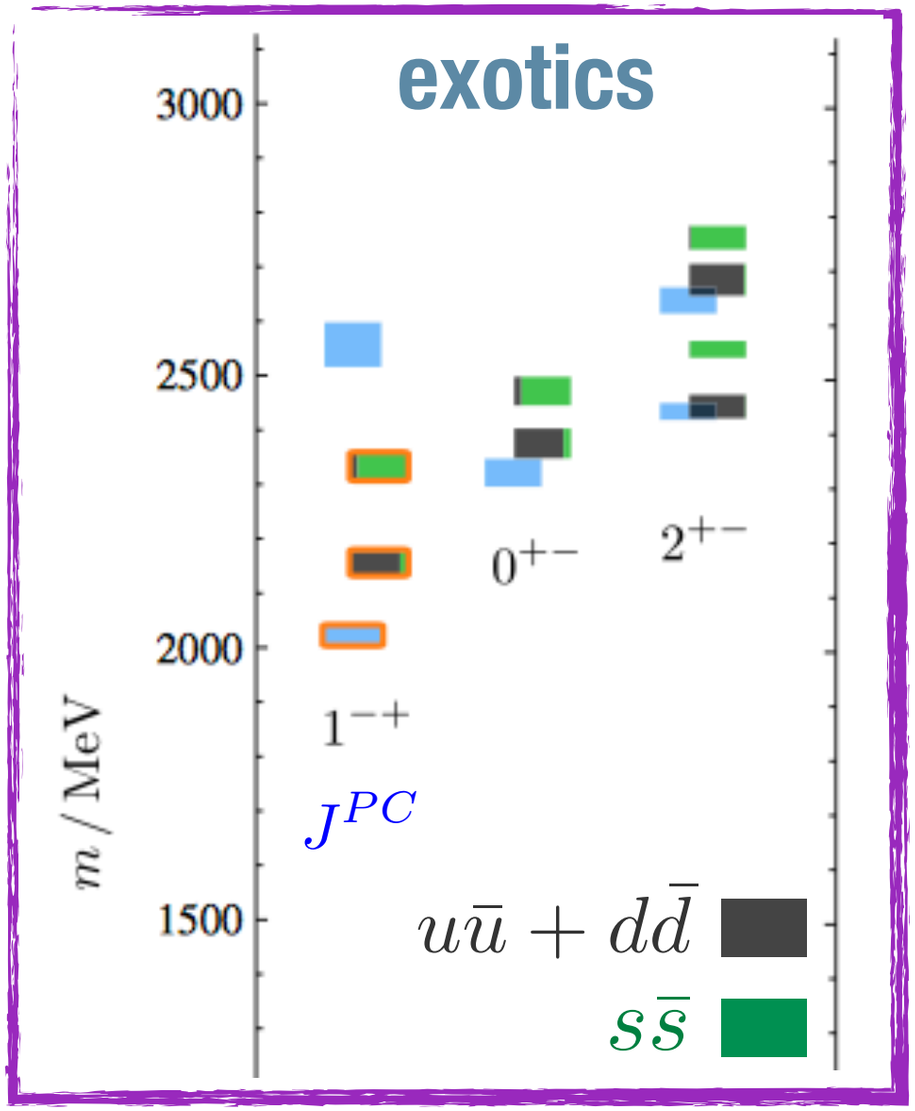
$$\gamma p \to p e^+ e^-$$





Strangeness program

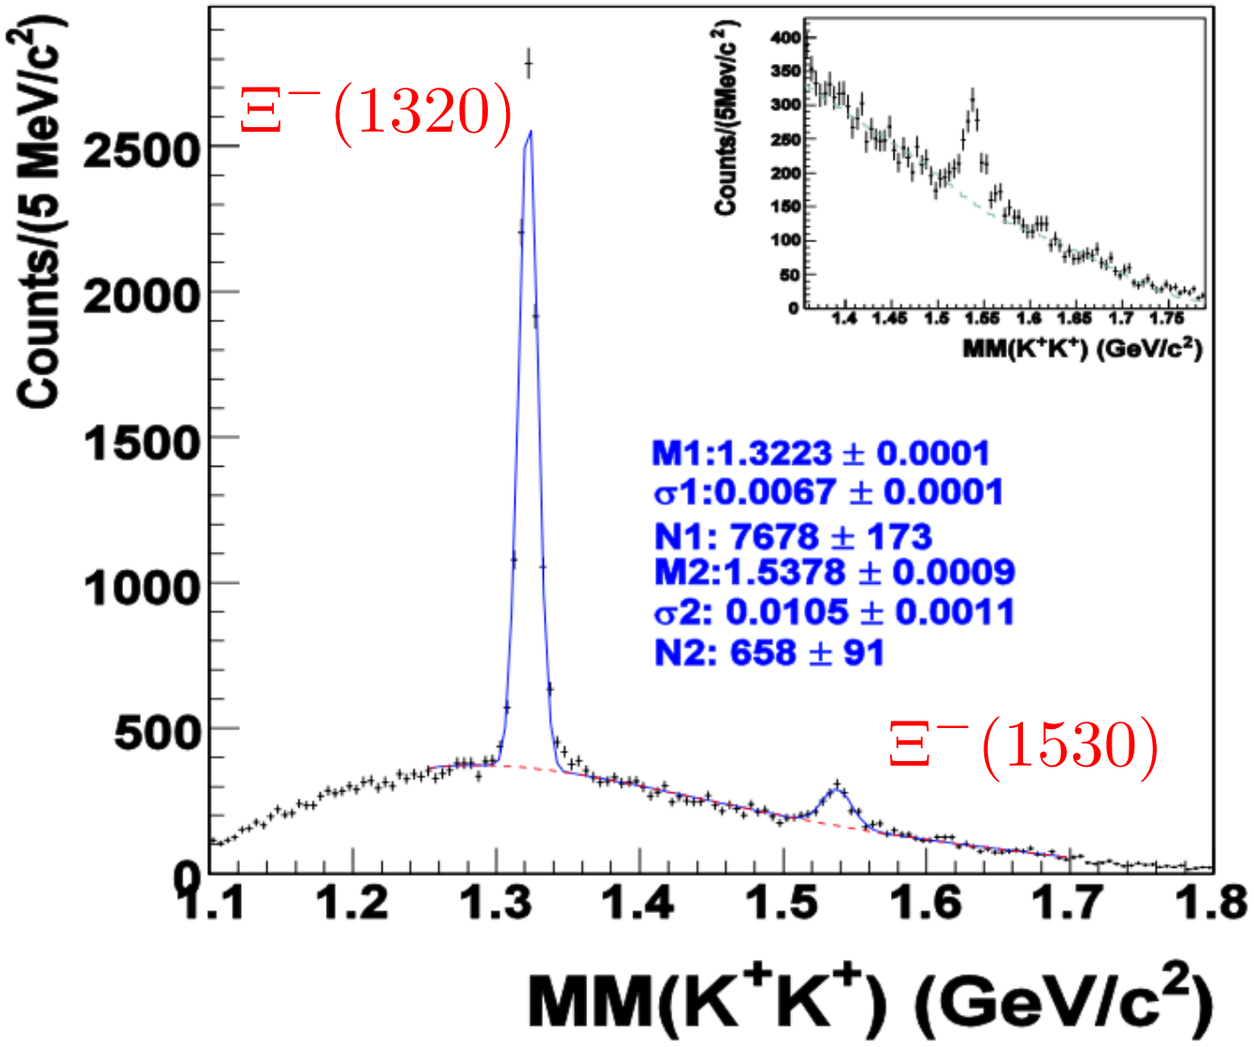
	J^{PC}	Allowed Decay Modes
π_1	1^{-+}	$b_1\pi$, $\pi\rho$, πf_1, $\pi\eta$, $\pi\eta'$, ηa_1, $\pi\eta(1295)$
η_1	1^{-+}	πa_1, πa_2, ηf_1, ηf_2, $\pi\pi(1300)$, $\eta\eta'$, KK_1^A, KK_1^B
η_1'	1^{-+}	KK_1^B, KK_1^A, KK^*, $\eta\eta'$
b_0	0^{+-}	$\pi\pi(1300)$, πh_1, ρf_1, ηb_1
h_0	0^{+-}	πb_1, ηh_1, $KK(1460)$
h_0'	0^{+-}	$KK(1460)$, KK_1^A, ηh_1
b_2	2^{+-}	πa_1, πa_2, πh_1, $\eta\rho$, ηb_1, ρf_1
h_2	2^{+-}	$\pi\rho$, πb_1, $\eta\omega$, ωb_1
h_2'	2^{+-}	KK_1^B, KK_1^A, KK_2^*, ηh_1

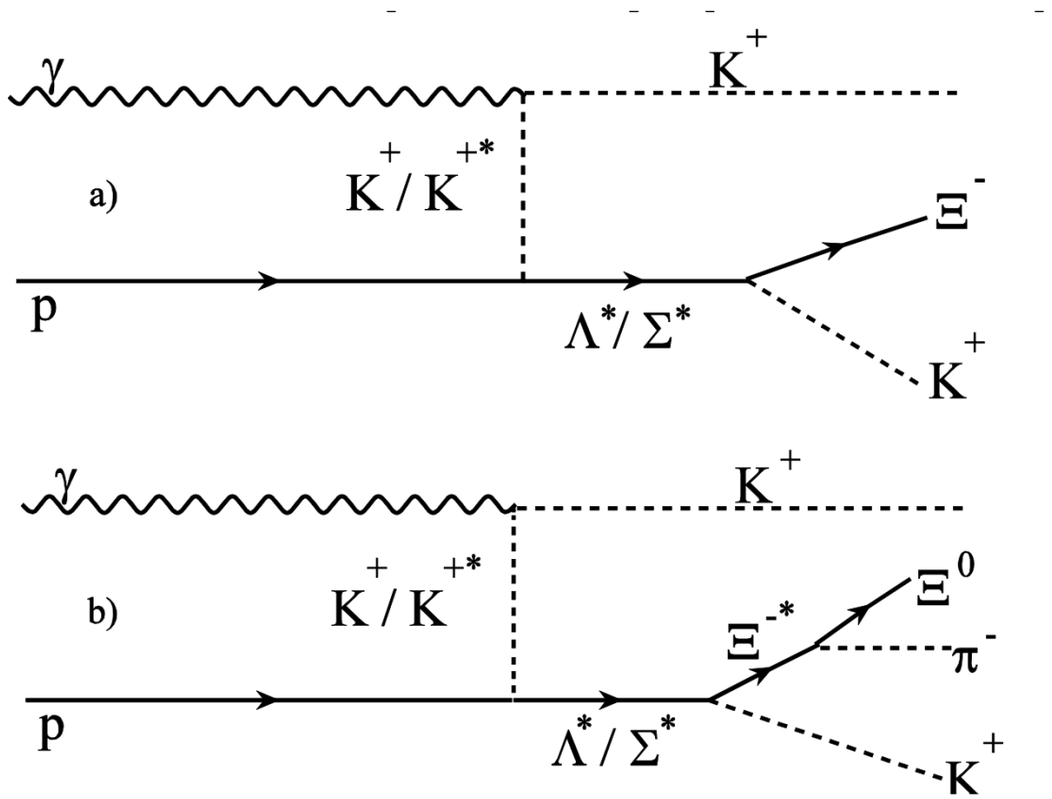


- Mapping the hybrid spectrum requires: large statistics samples of many particle final states in **strange** and **non-strange** decay modes
- Experimentally access to strangeness content of the state by comparing strange vs non-strange decay modes

Hyperon Spectroscopy: $\Xi^-(dss)$

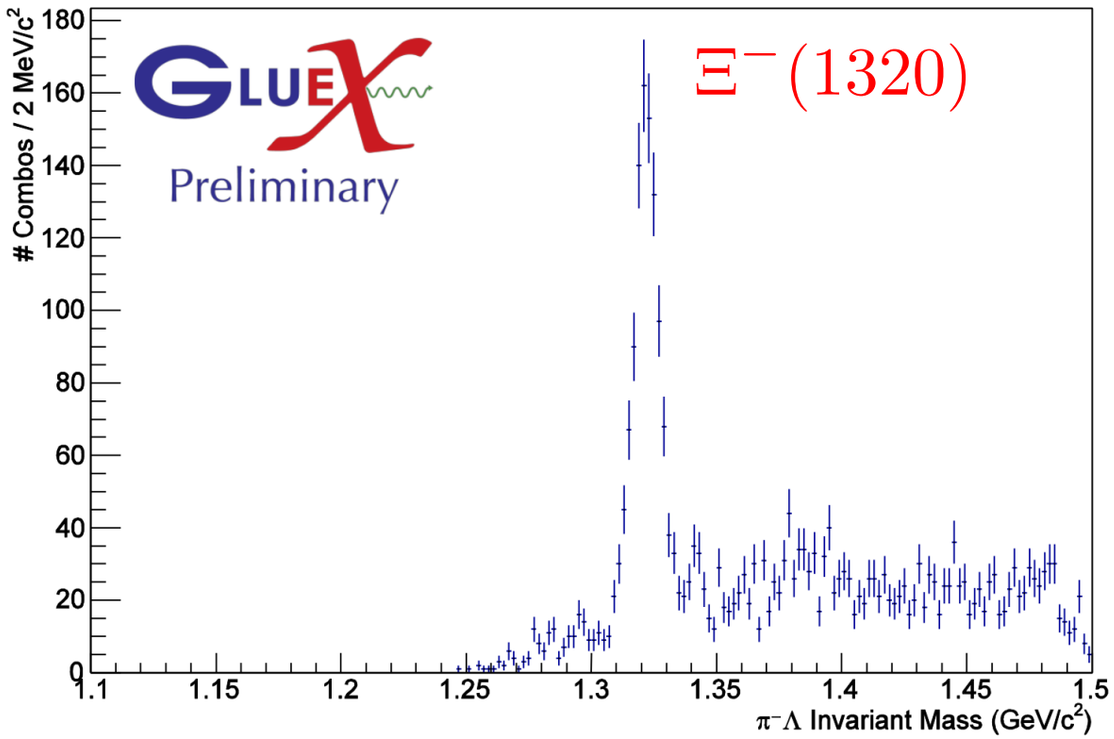
6 GeV



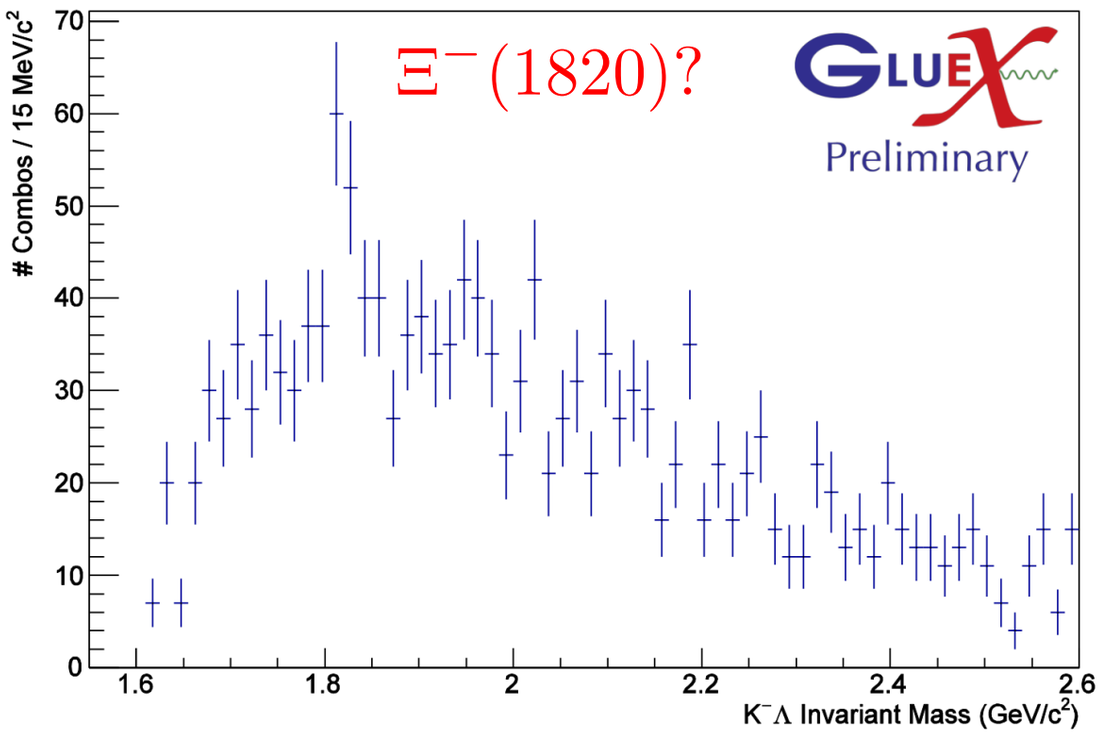


Hyperon Spectroscopy: $\Xi^-(dss)$

$$\gamma p \to K^+ K^+ \Lambda \pi^-$$

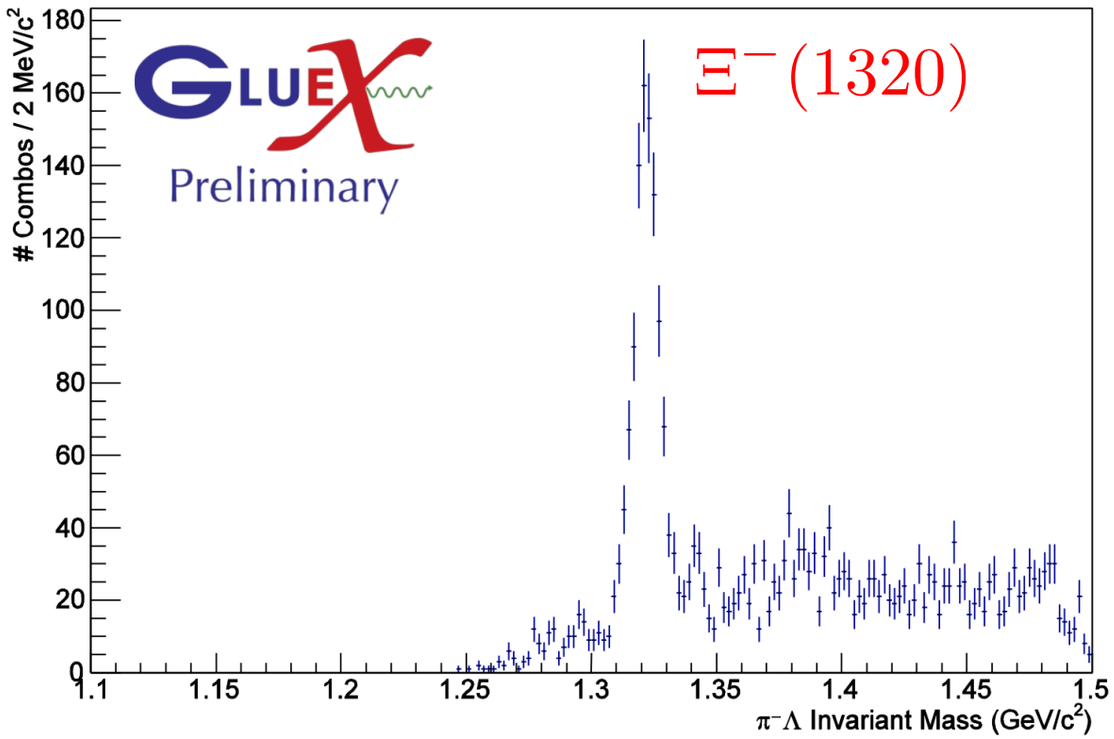


$$\gamma p \to K^+ K^+ \Lambda K^-$$

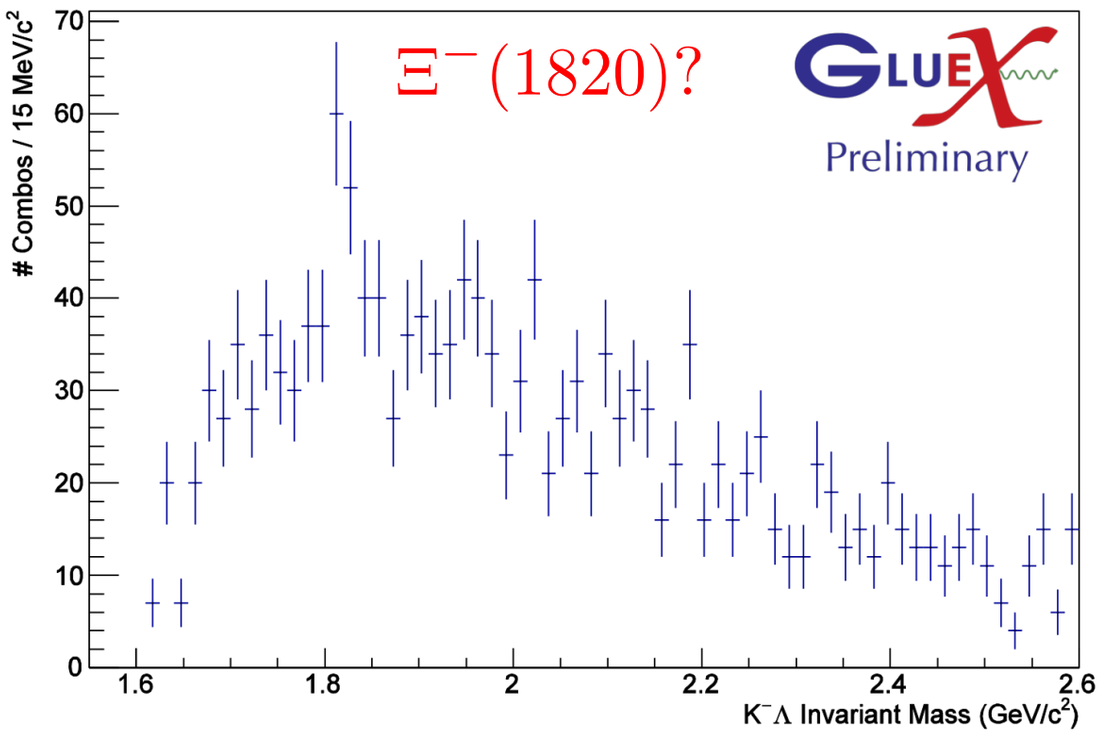


Hyperon Spectroscopy: $\Xi^-(dss)$

$\gamma p \to K^+ K^+ \Lambda \pi^-$



$\gamma p \to K^+ K^+ \Lambda K^-$



- **Longer term:** K_L beam facility (PAC proposal)
