Quarkonium production in hadronic collisions: Small-*x* saturation and TMD evolution

Kazuhiro Watanabe

Old Dominion Univ

May 23, 2017 QCD evolution 2017

= ~ ~ ~

- Gluon bremsstrahlung + recombination at small Bjorken  $x \Rightarrow$  "Saturation" : Small-x saturation/Color-Glass-Condensate framework.
- Probes : single hadron, dijet, heavy flavor/quarkonium productions in forward pp and pA collisions.

• • • • • • • • • • • •

#### Motivation

Naively, we anticipate that the saturation scale  $Q_s$  should characterize  $P_{\perp}$  spectra of quarkonia production in pA and pp at forward rapidity. We need a test on the CGC framework.

- $J/\psi$  production
  - The CGC framework with CEM/NRQCD can reproduce the data of low  $P_{\perp}$  spectra in pp/pA at LHC.
- Y production
  - The saturation effect cannot provide enough  $P_{\perp}$  broadening  $\implies$  Additional parton shower effect (Sudakov) is required to interpret data.
- ✓ We will discuss implementations of Sudakov factor in the improved CGC model.
- ✓ Check the dominant effect: Saturation? or Suakov? or Both?

• All of the correlators can be cast into

$$\begin{split} S^{(4)}_{q\bar{q}q\bar{q}}(x,y,y',x') &\approx S^{(2)}_{xg}(x_{\perp},x'_{\perp})S^{(2)}_{xg}(y_{\perp},y'_{\perp}), \\ S^{(3)}_{q\bar{q}g}(x,y,v') &\approx S^{(2)}_{xg}(x_{\perp},v'_{\perp})S^{(2)}_{xg}(v'_{\perp},y_{\perp}), \\ S_{gg}(v,v') &\approx S^{(2)}_{xg}(v_{\perp},v'_{\perp})S^{(2)}_{xg}(v'_{\perp},y_{\perp}), \end{split}$$

• The differential xsection in momentum space:

$$\frac{d\sigma_{\rm L}^{\rm op\to q\bar{q}X}}{d^2 p_{1\perp} d^2 p_{2\perp} dy_1 dy_2} = \frac{\alpha_s S_{\perp}}{(2\pi)^2} x G(x) \int d^2 q_{1\perp} d^2 q_{2\perp} F_{xg}(q_{1\perp}) F_{xg}(q_{2\perp}) \delta^{(2)}(P_{\rm tot} - q_{1\perp} - q_{2\perp}) \hat{H}_{\rm LO}(q_{1\perp}) d^2 q_{1\perp} d^2 q_{2\perp} F_{xg}(q_{1\perp}) F_{xg}(q_{1\perp}) \delta^{(2)}(P_{\rm tot} - q_{1\perp} - q_{2\perp}) \hat{H}_{\rm LO}(q_{1\perp}) d^2 q_{1\perp} d^2 q_{$$

with  $F_{xg}(k_{\perp}) = \int \frac{d^2 r_{\perp}}{(2\pi)^2} e^{-ik_{\perp} \cdot r_{\perp}} S_{xg}^{(2)}(r_{\perp})$  the dipole amplitude.

- All of the color and spin in final state are summed up. ⇒ Dipole type Unintegrated Gluon Distribution Function (UGDF) is essential.
- $k_{\perp}$ -factorization is violated.

◆□▶ ◆□▶ ◆三▶ ◆三▶ ◆□▼ のへの

• Rapidity dependence of the dipole amplitude (S = 1 - T)  $\Leftarrow$  Balitsky-Kovchegov equation [Balitsky (1995)][Kovchegov (1996)]

$$\frac{dT_{xg}\left(r\right)}{d\ln 1/xg} = \mathcal{K} \otimes \left[\underbrace{T_{xg}\left(r_{1}\right) + T_{xg}\left(r - r_{1}\right) - T_{xg}\left(r\right)}_{\text{BFKL}} \underbrace{-T_{xg}\left(r_{1}\right)T_{xg}\left(r - r_{1}\right)}_{\text{Recombination}}\right]$$

• The running coupling kernel in Balitsky's prescription is well controllable numerically. [Balitsky (2006)]

$$\mathcal{K}(r_{\perp}, r_{1\perp}) = \frac{\alpha_s(r_1^2) N_c}{2\pi^2} \left[ \frac{1}{r_1^2} \left( \frac{\alpha_s(r_1^2)}{\alpha_s(r_2^2)} - 1 \right) + \frac{r^2}{r_1^2 r_2^2} + \frac{1}{r_2^2} \left( \frac{\alpha_s(r_2^2)}{\alpha_s(r_1^2)} - 1 \right) \right]$$

• Set Initial condition to be McLerran-Venugopalan model like functional form:

$$S_{x=0.01}(r_{\perp}) = \exp\left[-\frac{\left(r_{\perp}^2 \mathcal{Q}_{s0,p}^2\right)^{\gamma}}{4}\ln\left(\frac{1}{r_{\perp}\Lambda} + e\right)\right]$$

✓ Input parameters  $\gamma$ ,  $Q_{s0,p}^2$  are precisely constrained from HERA-DIS global data fitting. [AAMQS (2010)]

◆□▶ ◆□▶ ◆三▶ ◆三▶ ◆□▼ のへの

- $x_{1,2} = M/\sqrt{s}e^{\pm y}$  reads  $x_2 = 8.1 \times 10^{-6}$  for  $J/\psi$  production at  $\sqrt{s} = 7$  TeV,  $y = 4 \Longrightarrow$  $Y \approx 7$  when  $x_0 = 0.01 \longleftrightarrow Q_{s,p} = 1 \sim 2$  GeV for proton
- For nucleus,  $Q_{s,A} = (2 \sim 3)Q_{s,p}$

• □ > • □ > • □ > •

✓ From now on in this talk, Color Evaporation Model (CEM) is employed:

$$\frac{d\sigma_{\psi}}{d^2 P_{\perp} dy} = F_{q\bar{q} \to \psi} \int_{2m_q}^{2M_Q} dM \frac{d\sigma_{q\bar{q}}}{dM d^2 P_{\perp} dy}$$

- $q\bar{q}$  converts into  $\psi$  with the probability  $F_{q\bar{q}\to\psi}$ .
- We disregard complicated bound state formation dynamics, but our discussion would be simplified.
- As long as low  $P_{\perp}$  production, CEM is reasonable in accordance with the large- $N_c$  approximation.
- CGC+NRQCD ⇒ See [Kang, Ma, Venugopalan (2013)][Ma, Venugopalan (2014)]

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

[Fujii, K.W. (2013)][K.W., Xiao (2015)]

- The CGC can describe  $J/\psi$  production, since the saturation scale is "Hard"  $\rightarrow m_c \leq Q_s \approx \langle P_\perp \rangle$ .
- For  $\Upsilon$  production, the saturation scale is "Soft"  $\rightarrow m_b > Q_s \approx \langle P_{\perp} \rangle$ . More  $P_{\perp}$  broadening effect is required.

Let us consider  $\Upsilon$  production further!

#### ④ Summary

Kazuhiro Watanabe (ODU)

Quarkonium production in hadronic collisions

May 23, 2017 13 / 23

### CSS formalism

[Collins-Soper-Sterman (1985)][Berger, Qiu, Wang (2005)][Sun, Yuan, Yuan (2012)]

Heavy quark pair production with soft gluon emissions:

$$\frac{d\sigma^{\text{pp}} \rightarrow q\bar{q} + X}{d^2 P_{\perp} dy} = \int \frac{d^2 b_{\perp}}{(2\pi)^2} e^{i P_{\perp} \cdot b_{\perp}} \underbrace{W(M, b_{\perp}, x_1, x_2)}_{\text{resum}} + \underbrace{(d\sigma_{\text{perp}} - d\sigma_{\text{asy}})}_{\text{Y-term}}$$

where *W* satisfies  $\frac{\partial}{\partial \ln Q^2} W = [K + G]W$ : resummation of the large logs. It can be written as  $W(M, b_{\perp}, x_1, x_2) = \sum_{ij} d\phi_{L0}^{ij} \sqrt{q} \bar{q} W_{ij}(M, b_{\perp}) e^{-S_{ij}(M, b_{\perp})}$  with

$$\left\{ \begin{array}{c} W_{ij}(M,b_{\perp}) = \sum_{a,b} \int \frac{d\underline{\varepsilon}}{\underline{\varepsilon}} \frac{d\underline{\varepsilon}'}{\underline{\varepsilon}'} C_{a \to i} \left(\frac{x_A}{\underline{\varepsilon}}\right) C_{b \to j} \left(\frac{x_B}{\underline{\varepsilon}'}\right) \underbrace{\phi_{a/A}(\underline{\varepsilon},\mu)\phi_{b/B}(\underline{\varepsilon}',\mu)}_{\text{collinear-pdfs}} \\ S_{ij}(M,b) = \int_{C_0/b^2}^{M^2} \frac{d\mu^2}{\mu^2} \left[ A_{ij} \ln\left(\frac{M^2}{\mu^2}\right) + B_{ij} \right] \end{array} \right.$$

A, B, C are calculated perturbatively.

◆□▶ ◆□▶ ◆目▶ ◆日▶ ◆□▼ ◆○

CSS type extrapolation

$$W(M, b_{\perp}) = W^{\text{perp}}(M, b_{\star})F^{\text{NP}}(M, b_{\perp})$$

with  $b_{\star} = \frac{b}{\sqrt{1 + (b/b_{\text{max}})^2}} < b_{\text{max}} = 0.5 \text{ GeV}^{-1}.$ 

✓ NP form factor at  $b > b_{max}$  :for example, [Sun, Yuan, Yuan (2012)]

$$F^{\rm NP}(M, b_{\perp}) = \exp\left[b_{\perp}^2 \left(-g_1 - g_2 \ln\left(\frac{M}{2Q_0}\right) - g_1 g_3 \ln(100x_1 x_2)\right)\right]$$

 $g_1, g_2, g_3$  are obtained by data fitting.

• Matching type extrapolation [Qiu, Zhang (2001)]

$$W(M, b_{\perp}) = \begin{cases} W^{\text{perp}}(M, b_{\perp}) & b_{\perp} \le b_{\text{max}} \\ W^{\text{perp}}(M, b_{\text{max}}) F^{\text{NP}}(M, b_{\perp}; b_{\text{max}}) & b_{\perp} > b_{\text{max}} \end{cases}$$

✓ NP form factor at  $b_{\perp} > b_{\max}$ 

$$F^{\rm NP}(b_{\perp}, M) = \exp\left[-\ln\left(\frac{M^2 b_{\rm max}^2}{c^2}\right) \left[g_1((b_{\perp}^2)^{\alpha} - (b_{\rm max}^2)^{\alpha}) + g_2(b_{\perp}^2 - b_{\rm max}^2)\right] - \bar{g}_2(b_{\perp}^2 - b_{\rm max}^2)\right]$$

 $g_1, \alpha$  are obtained by connecting  $W^{\text{perp}}$  and  $F^{\text{NP}}$  smoothly at  $b_{\perp} = b_{\text{max}}$ .  $g_2, \bar{g}_2$  are obtained from data fitting.

Kazuhiro Watanabe (ODU)

# $b_{\perp}$ -distributions for $b\bar{b}$ production

- s ↑ ⇒ b<sub>sp</sub> shifts toward small b<sub>⊥</sub> : Perturbative domains (b < b<sub>max</sub> = 0.5[GeV<sup>-1</sup>]) are essential. F<sup>NP</sup> is not crucial for bb̄ production at Tevatron & LHC.
- $y \uparrow \Longrightarrow b_{sp}$  shifts toward large  $b_{\perp}$  but  $b_{sp} < b_{max}$ .

= 200

#### [Berger, Qiu, Wang (2005)][Qiu, K.W. (2017)]

- CEM is used with resummation scheme :  $\mu = c/b_{\perp}$ .
- $P_{\perp} \leq M_{\Upsilon}/2 : d\sigma_{\text{resum}}, P_{\perp} \geq M_{\Upsilon}/2 : d\sigma_{\text{perp}}$

Next  $\implies$  How about pA? Consider the saturation effect and the Sudakov effect together!

#### 3 Implementation of Sudakov factor in the CGC framework

#### ④ Summary

Kazuhiro Watanabe (ODU)

Quarkonium production in hadronic collisions

May 23, 2017 18 / 23

(日)

# Improved CGC-Hybrid framework

[K.W., Xiao (2015)]

- Indeed, NLO calculations for  $q\bar{q}$  production have not completed in the CGC framework. But assume that large logarithms concerning soft gluon emission can be resummed over.
- The soft gluon shower effect and the saturation effect can be described straightforwardly in the dipole model based approach:

$$d\sigma_{\text{resum}}^{\text{pp}\to q\bar{q}+X} \propto \int \frac{d^2 u_{\perp} d^2 v_{\perp}}{(2\pi)^4} \ e^{-iP_{\text{rel}}\cdot u_{\perp}} e^{iP_{\perp}\cdot v_{\perp}} x_1 G\left(x_1, \frac{c_0}{v_{\perp}}\right) S_{xg}\left(x_{\perp}\right) S_{xg}\left(y_{\perp}\right) e^{-S_{\text{Sud}}(M, v_{\perp})} \hat{H}_{\text{LO}},$$

with  $x_{\perp} = v_{\perp} + (1 - z)u_{\perp}$  and  $y_{\perp} = v_{\perp} - zu_{\perp}$ .

- $e^{-S_{\text{Sud}}(M,v_{\perp})}$  must be "Universal".
- *P*<sub>rel</sub> is integrated over in the CEM.

• • • • • • • • • • • • •

# $\Upsilon$ production in pp collisions with Parton shower effect

[KW and Xiao (2015)]

- Resummation scheme :  $\mu = c/b_{\perp}$ .
- Parton shower (Sudakov) effect is dominant for low- $P_{\perp}$  Y production in pp collisions.
- For  $J/\psi$  production, NP Sudakov form factor is crucial.

• • • • • • • • •

#### Predictions at pA collision

Kazuhiro Watanabe (ODU)

# CGC

## 2 TMD

Implementation of Sudakov factor in the CGC framework

(日)

- Motivation: we want to study whether quarkonium production is a promising probe into the gluon saturation in hadron/nucleus.
- What we have done is computing  $P_{\perp}$  spectra of  $J/\psi$  and  $\Upsilon(1S)$  in pp and pA collisions by using two different framework: CGC and TMD framework.
- ✓ pp collision
  - $J/\psi$  is better, since  $m_c \leq Q_s$ . Soft gluon emission effect can be not large but the nonperturbative form factor is essential.
  - The results in the CGC and TMD frameworks show clearly that soft gluon emissions effect is predominant over the saturation effect for  $\Upsilon$  production.
- ✓ pA collision
  - $m_c < Q_{s,A}$  and  $m_b \sim Q_{s,A}$ .  $P_{\perp}$  distribution of Nuclear modification factor is sensitive to a combination of the small-*x* effect and parton shower effect.

Soft gluons emission on top of the BK resummation modifies  $p_{\perp}$ -dependence.

$$\frac{d\sigma_{Q\bar{Q}}}{d^2q_{Q\perp}d^2q_{\bar{Q}\perp}dy_qdy_{\bar{Q}}} = \frac{\alpha_s^2 \overline{S}_\perp}{16\pi^2 C_F} \int d^2l_\perp d^2k_\perp \frac{\Xi_{\text{coll}}(k_{2\perp}, k_\perp - zl_\perp)}{k_{2\perp}^2} \times \frac{F_{\text{TMD}}(l_\perp)F_{Y_g}(k_\perp)F_{Y_g}(k_{2\perp} - k_\perp + l_\perp)}{F_{Y_g}(k_{2\perp} - k_\perp + l_\perp)}$$

where the TMD gluon distribution is given by

$$F_{\text{TMD}}(M, l_{\perp}) = \int \frac{d^2 b_{\perp}}{(2\pi)^2} e^{-ib_{\perp} \cdot l_{\perp}} e^{-S_{\text{Sud}}(M, b_{\perp})} x_1 G\left(x_1, \mu = \frac{c_0}{b_{\perp}}\right).$$

1= 2000
