Outline

- Brief Introduction and existing data
- Proposed 6-GeV measurements
- Preliminary study with Solenoid and projections
- Summary

- It takes two Chiral-odd objects to measure transversity
 - Drell-Yan (Doubly transversely polarized p-p collision)
 - Semi-inclusive DIS
 - Chiral-odd distributions function (transversity)
 - Chiral-odd fragmentation function (Collins function)

Chiral-quark soliton model

The kinematics and coordinate

- E' is the energy of scattered electron
- θ_e is the scattering angle
- $\nu = E - E'$ is the energy transfer.
- k_T : quark transverse momentum

DIS: Q^2 and ν is large, but x is finite.

$$x = \frac{Q^2}{2P \cdot q}, \quad y = \frac{P \cdot q}{P \cdot P_e}, \quad z = \frac{P \cdot P_h}{P \cdot q}, \quad s = (P + q)^2$$

All Eight Quark Distributions Are Probed in Semi-Inclusive DIS

$$d^6\sigma = \frac{4\pi\alpha^2 sx}{Q^4} \times$$

$f_1 = \text{[Diagram: Unpolarized target, beam polarization not shown]}$

$h_1^\perp = \text{[Diagram: Polarized target, beam polarization not shown]}$

$h_{1L}^\perp = \text{[Diagram: Polarized target and beam polarization (longitudinal)]}$

$h_{1T} = \text{[Diagram: Polarized target and beam polarization (transverse)]}$

Sivers

$f_{1T}^\perp = \text{[Diagram: Sivers effect, target and beam polarizations shown]}$

$h_{1T}^\perp = \text{[Diagram: Sivers effect, target and beam polarizations shown]}$

$g_{1L} = \text{[Diagram: Polarized beam and target, beam polarization (longitudinal)]}$

$g_{1T} = \text{[Diagram: Polarized beam and target, beam polarization (transverse)]}$

$$\{ [1 + (1-y)^2] \sum_{q,\bar{q}} e_q^2 f_1^q(x) D_1^q(z, P_{h\perp}^2) + (1-y) \frac{P_{h\perp}^2}{4z^2 M_N M_h} \cos(2\phi_h^l) \sum_{q,\bar{q}} e_q^2 h_1^{\perp(1)q}(x) H_1^{\perp q}(z, P_{h\perp}^2) - |S_L| (1-y) \frac{P_{h\perp}^2}{4z^2 M_N M_h} \sin(2\phi_h^l) \sum_{q,\bar{q}} e_q^2 h_{1L}^{\perp(1)q}(x) H_1^{\perp q}(z, P_{h\perp}^2) + |S_T| (1-y) \frac{P_{h\perp}}{zM_h} \sin(\phi_h^l + \phi_S^l) \sum_{q,\bar{q}} e_q^2 h_1^q(x) H_1^{\perp q}(z, P_{h\perp}^2) + |S_T| (1-y + \frac{1}{2}y^2) \frac{P_{h\perp}}{zM_N} \sin(\phi_h^l - \phi_S^l) \sum_{q,\bar{q}} e_q^2 f_{1T}^{\perp(1)q}(x) D_1^q(z, P_{h\perp}^2) + |S_T| (1-y) \frac{P_{h\perp}^3}{6z^3 M_N^2 M_h} \sin(3\phi_h^l - \phi_S^l) \sum_{q,\bar{q}} e_q^2 h_{1T}^{\perp(2)q}(x) H_1^{\perp q}(z, P_{h\perp}^2) + \lambda_e |S_L| y (1 - \frac{1}{2}y) \sum_{q,\bar{q}} e_q^2 g_1^q(x) D_1^q(z, P_{h\perp}^2) + \lambda_e |S_T| y (1 - \frac{1}{2}y) \frac{P_{h\perp}}{zM_N} \cos(\phi_h^l - \phi_S^l) \sum_{q,\bar{q}} e_q^2 g_{1T}^{(1)q}(x) D_1^q(z, P_{h\perp}^2) \}$$

Unpolarized

Polarized target

Polarized beam and target

S_L and S_T : Target Polarizations; λ_e : Beam Polarization

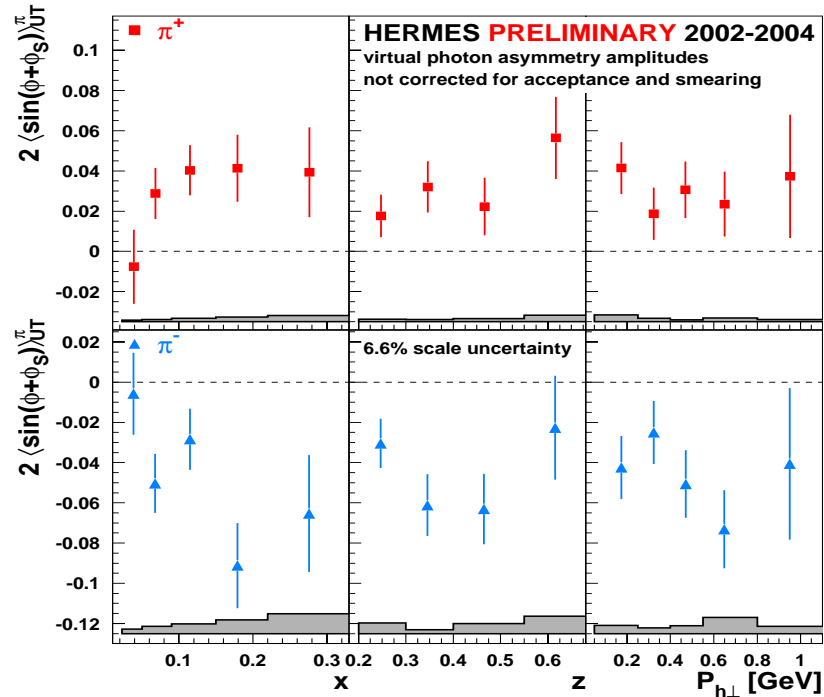

$A_{UT}^{\sin(\phi)}$ from transv. pol. H target

Simultaneous fit to $\sin(\phi + \phi_s)$ and $\sin(\phi - \phi_s)$

„Collins“
moments

hep-ex/0507013

- Product of $\delta q(x) H_1^\perp(z)$ is non-zero
- A surprising flavor dependence : $H_1^{\perp, unfavored} / H_1^{\perp, favored} \approx -1$
- Extraction of $\delta q(x)$ requires an independent measurement of Collins function $H_1^\perp(z)$ (BELLE)

Extraction of Collins functions from the Collins asymmetry measurements

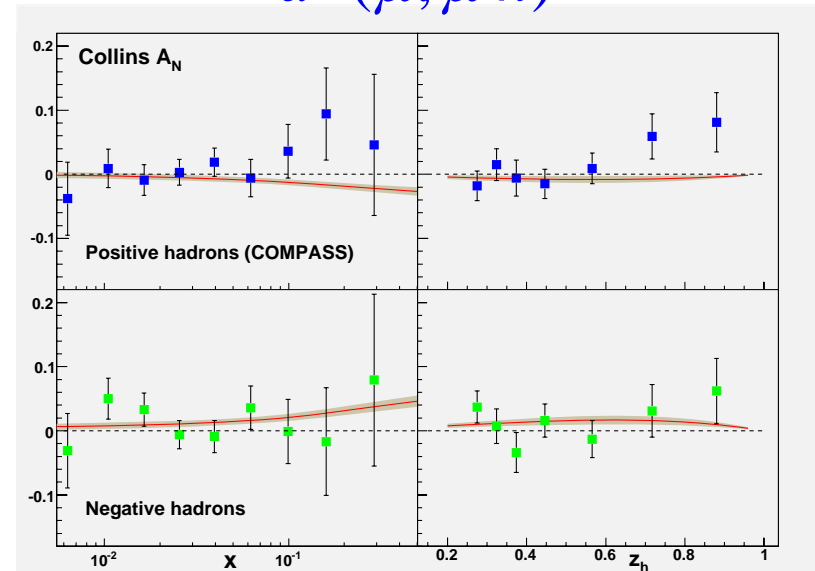

Fits to the Hermes data

$$p^\uparrow(e, e'\pi)$$

“Prediction” of the Compass data

$$d^\uparrow(\mu, \mu'h)$$

Assuming $H_1^{\perp, fav}(z) = C_{fav} z(1-z)D_1^{fav}(z)$; $H_1^{\perp, unfav}(z) = C_{unfav} z(1-z)D_1^{fav}(z)$

$$C_{fav} = -0.29 \pm 0.04, \quad C_{unfav} = 0.33 \pm 0.04$$

(Vogelsang and Yuan, hep-ph/0507266)

$$H_1^{\perp, unfavored} / H_1^{\perp, favored} \approx -1$$

Sivers moments from transversity experiments

$A_{UT}^{\sin(\phi-\phi_S)}$ from Hermes transv. pol. H target

"Sivers" moments

hep-ex/0507013

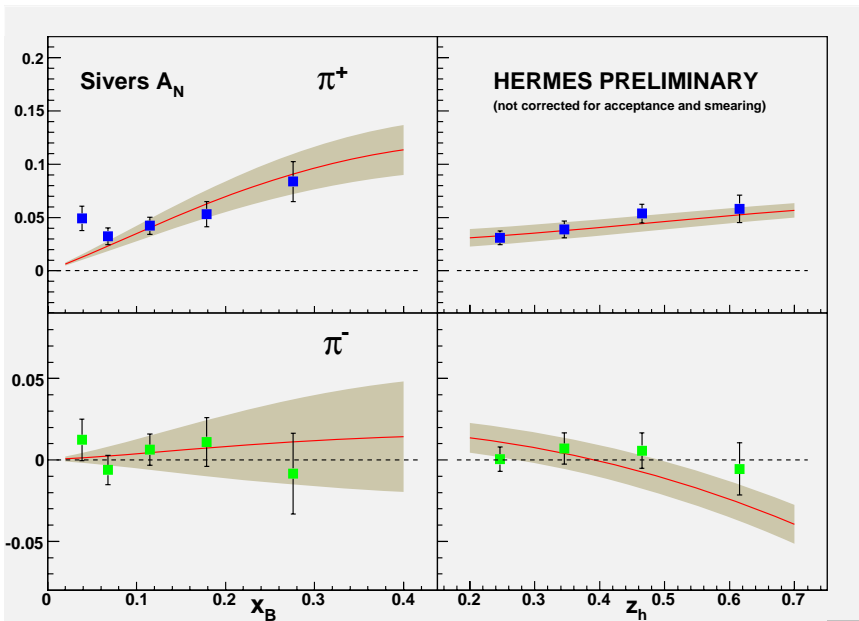

First measurement of Sivers asymmetry

Sivers function nonzero \rightarrow orbital angular momentum of quarks

Extraction of Sivers functions from the Sivers moment measurements

Fits to the Hermes data

“Prediction” of the Compass data

Assuming $f_{1T}^{\perp,u}(x) = S_u x(1-x)u(x)$; $f_{1T}^{\perp,d}(x) = S_d x(1-x)u(x)$

$$S_u = -0.81 \pm 0.07, \quad S_d = 1.86 \pm 0.28$$

(Vogelsang and Yuan, hep-ph/0507266)

Striking flavor dependence of the Sivers function

COMPASS leading hadron results

Figure 21: Overall results for Collins asymmetry (top) and Sivers asymmetry (bottom) against x , z and p_t^h for positive (full circles) and negative leading hadrons (open circles) from 2002, 2003, and 2004 data. Error bars are statistical only. In all the plots the open circles are slightly shifted horizontally with respect to the measured value.

COMPASS all hadron results

Figure 22: Overall results for Collins asymmetry (top) and Sivers asymmetry (bottom) against x , z and p_T^h for all positive (full circles) and all negative hadrons (open circles) from 2002, 2003, and 2004 data. Error bars are statistical only. In all the plots the open circles are slightly shifted horizontally with respect to the measured value.

Transversity Experiments at Hall A

E-06-010 (update of E-03-004) + E-06-011

Single Target-Spin Asymmetry in Semi-Inclusive $n^\uparrow (e, e' \pi^{+/-})$ Reaction on a Transversely Polarized ^3He Target

Spokespersons:

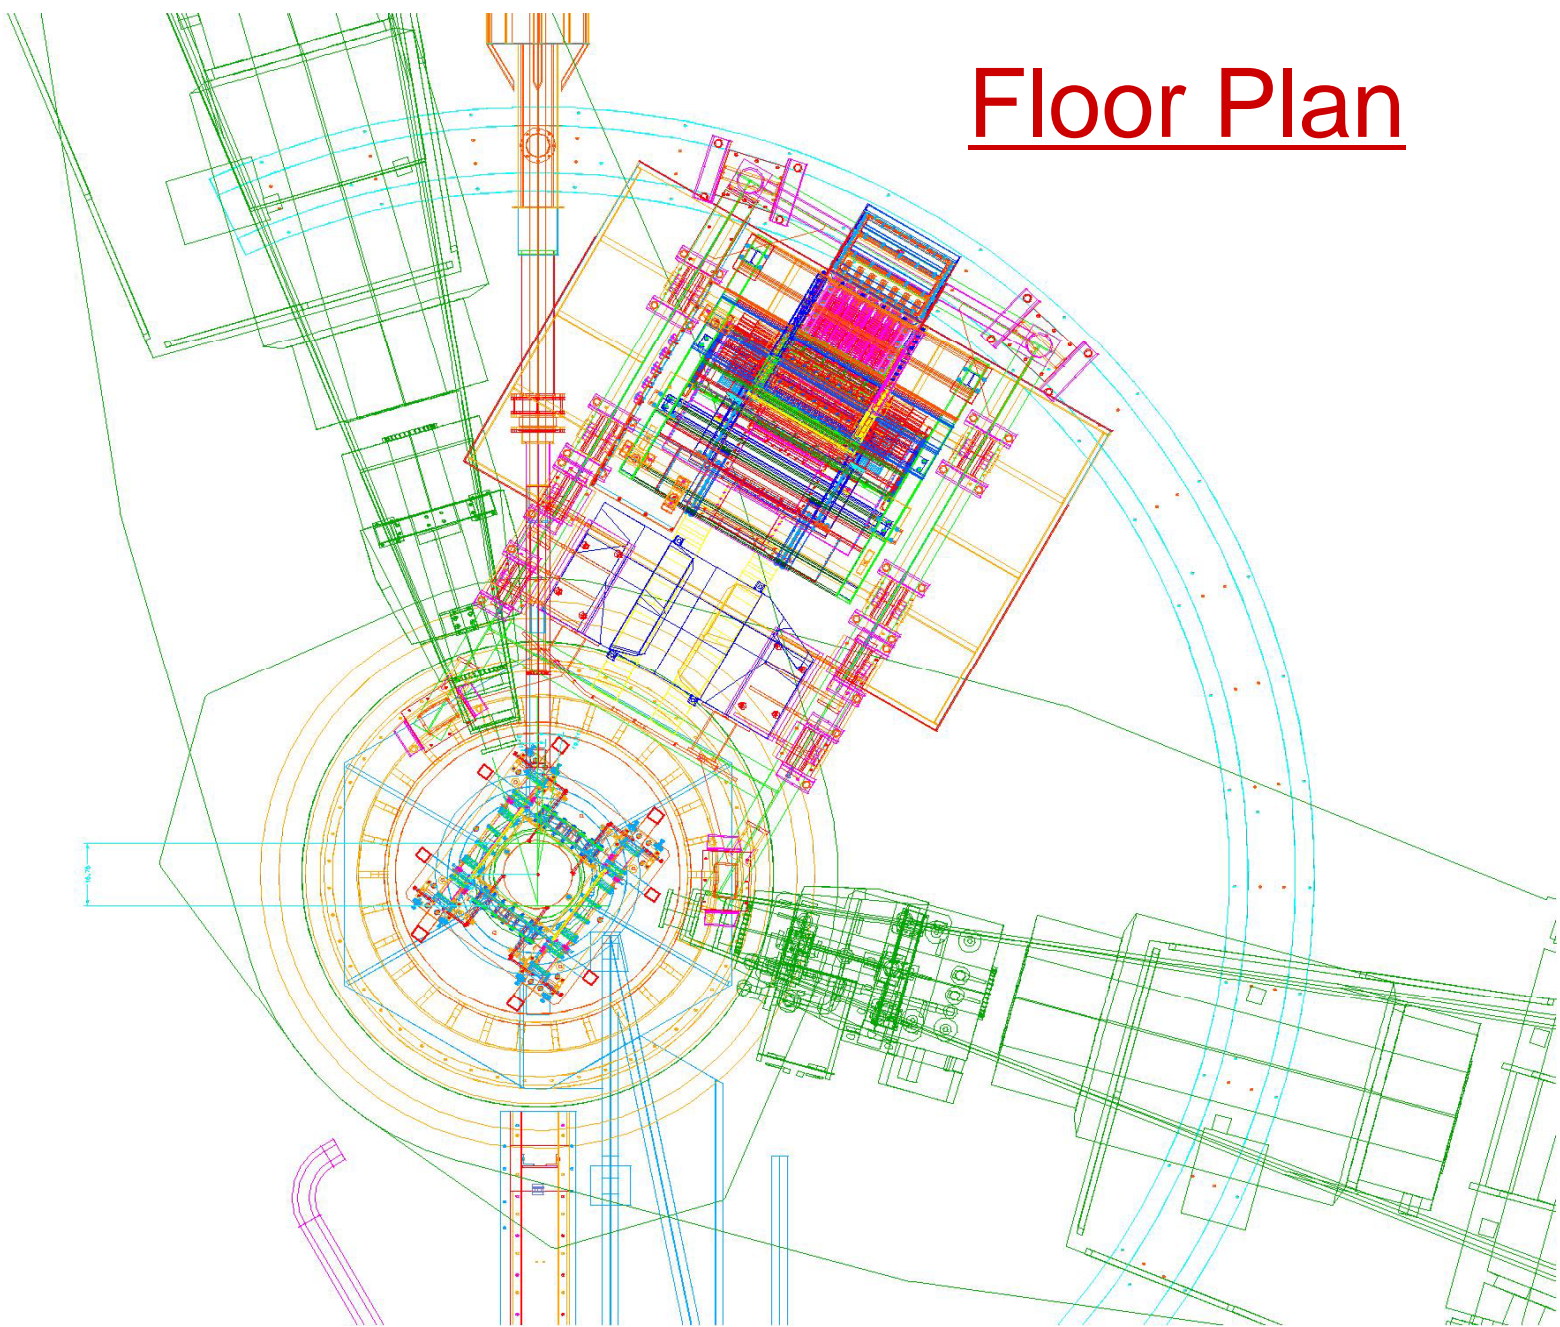

Xiaodong Jiang (Rutgers, Contact Person)

Jian-ping Chen (JLab), Evaristo Cisbani (INFN-Rome)

Haiyan Gao (Duke), Jen-Chieh Peng (UIUC)

Approved with A rating, combined beam time of 29 days

Floor Plan

Transversely polarized ^3He target

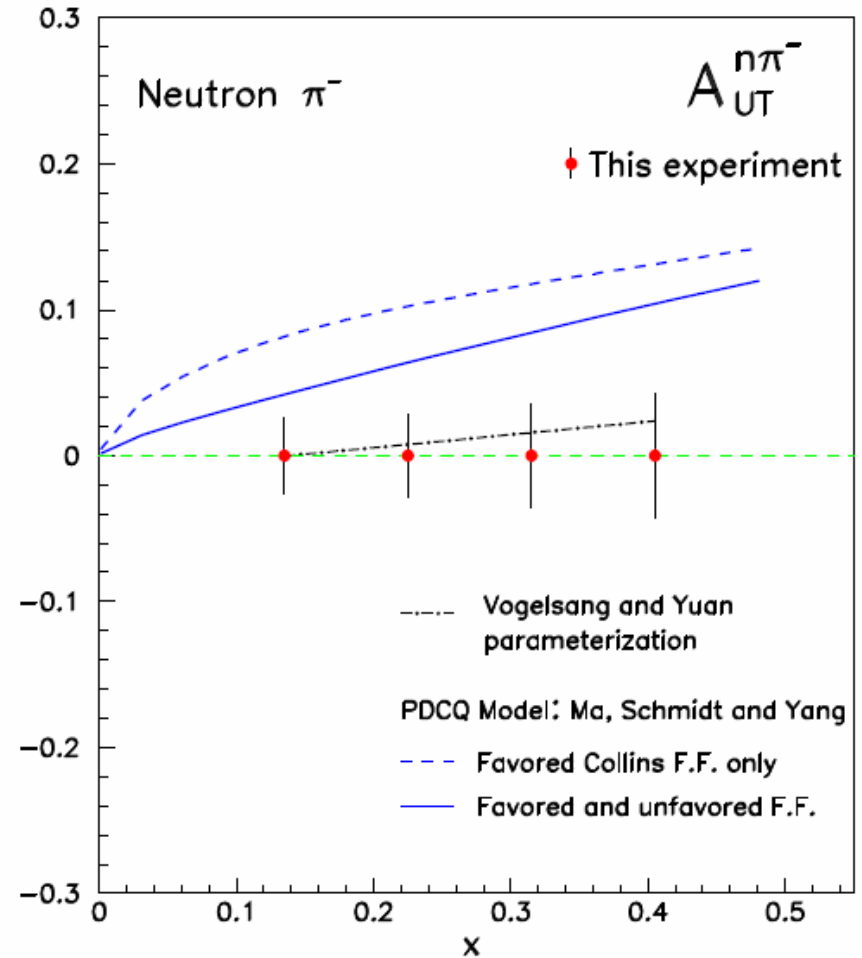

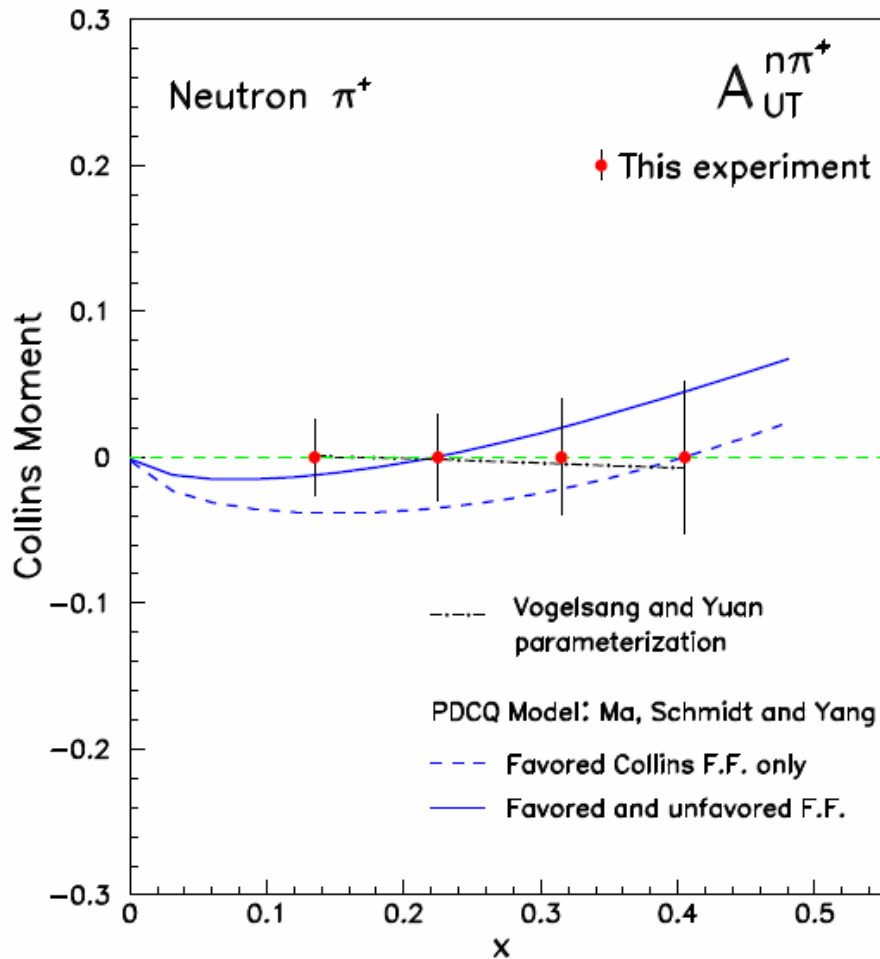

Target polarization orientation can be rotated to increase the coverage in Φ_S^l

Vertical Coil Design

Predictions of Collins asymmetry on neutron

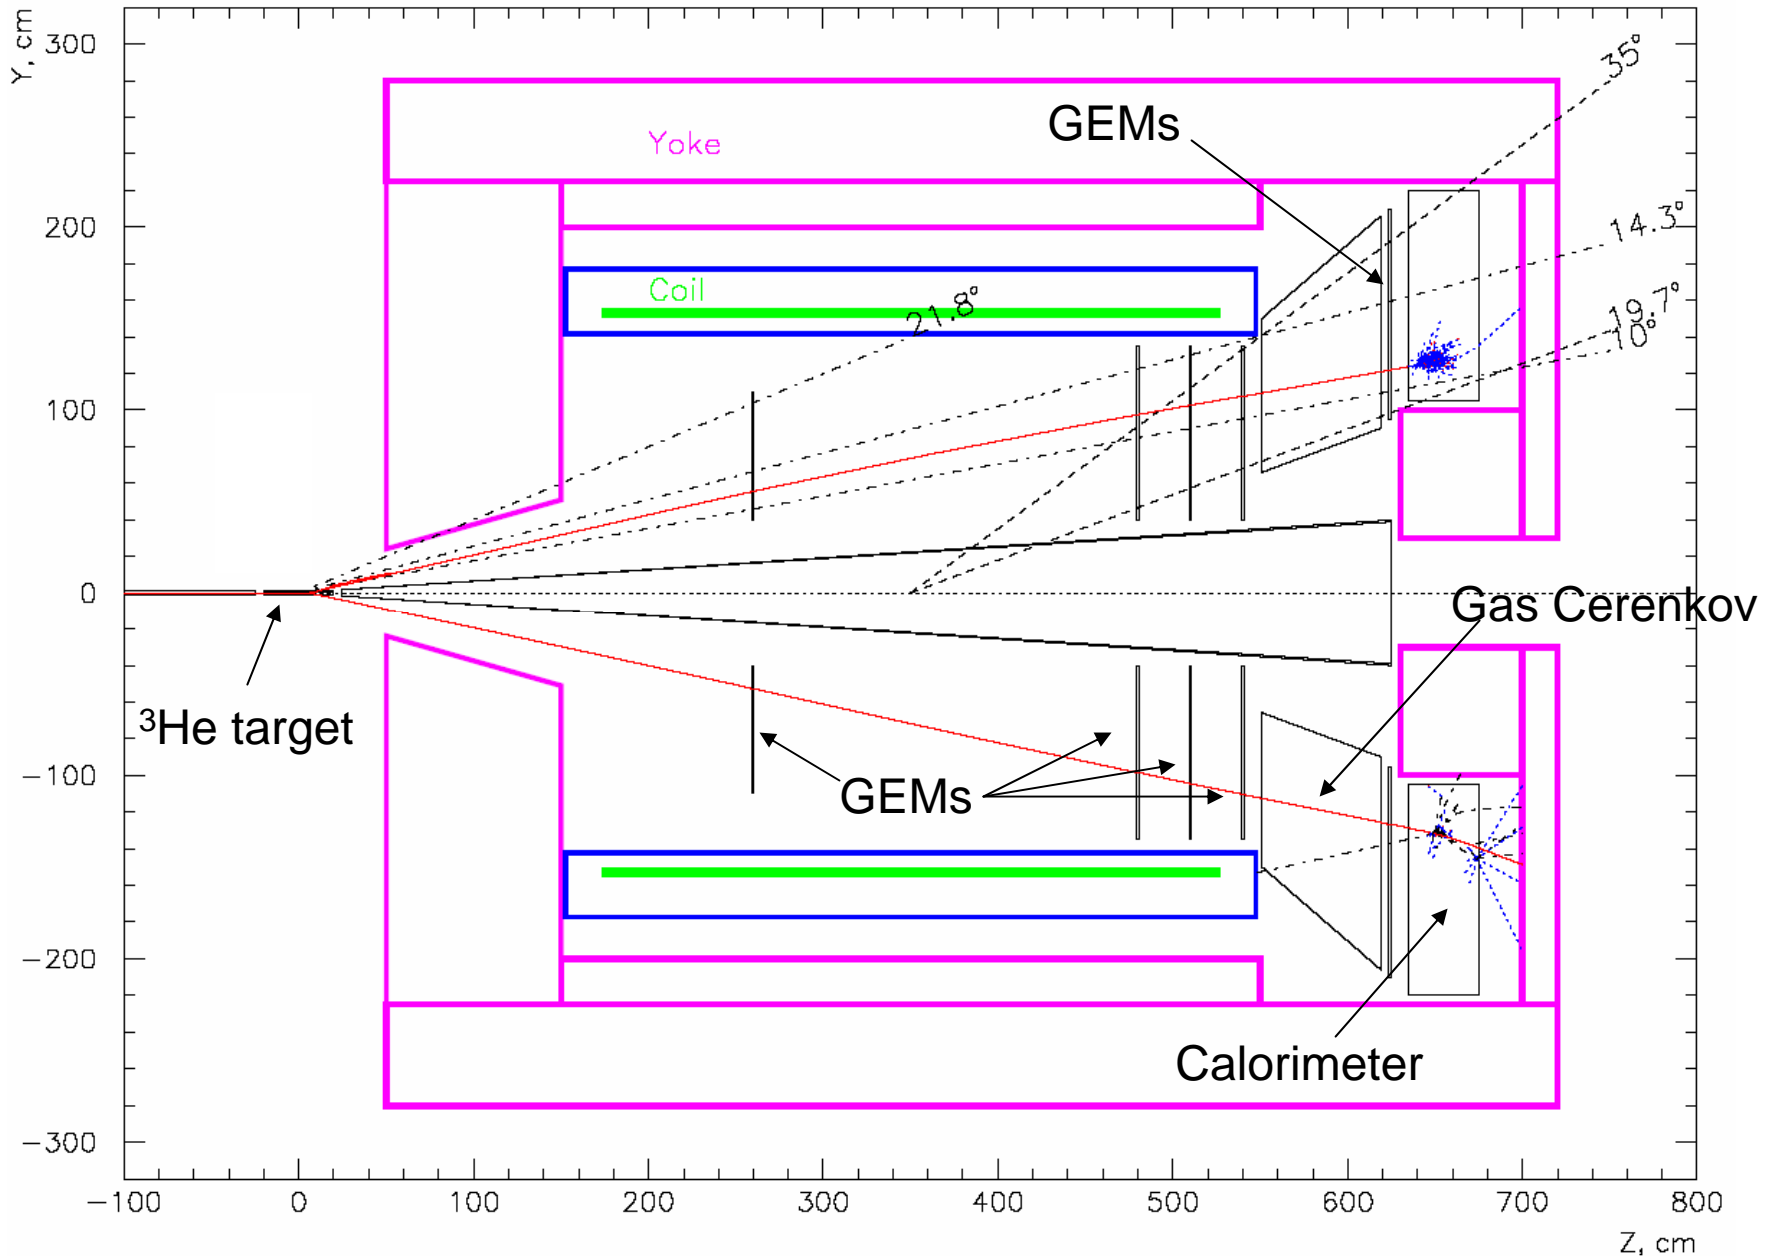

The errors with approved beam time will be 33% higher.

Predictions of Sivers asymmetry on neutron

The errors with approved beam time will be 33% higher.

Solenoid detector for SIDIS

Simulation

- Geant3 simulation: COMGEANT
 - From Eugene Chudakov.
- Event generator (SIDIS):
 - Modified from cross-section calculation code (Xiaodong Jiang, Lingyan Zhu and Xin Qian)
 - Using CTEQ6.
 - Using AKK fragmentation function parameterization.
- Detector Geometry:
 - Assume 17 degrees as the maximum angle
 - 14.3 degree (newest number)
- 40 cm transversely polarized ^3He target. (45% polarization with spin flip technique)

Phase space I

- After DIS selection:
 - $W > 2.3$ GeV
 - $W' > 1.6$ GeV
 - $Q^2 > 1.0$ GeV²
 - $0.3 < z < 0.7$

Phase space II

- Full coverage of azimuthal angle.
- Large P_T coverage.

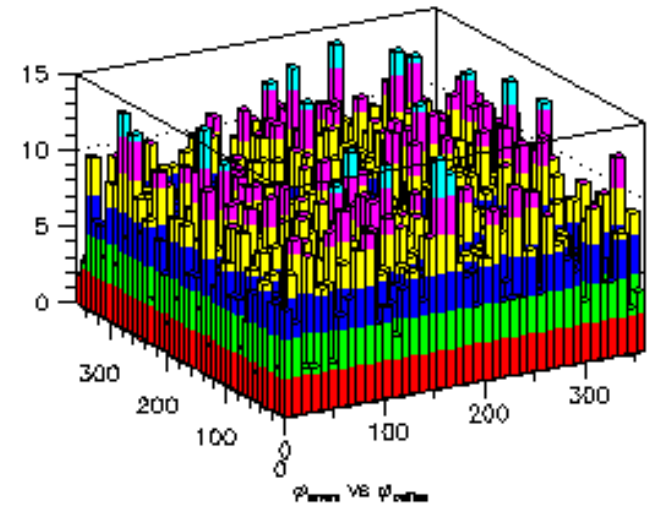

P_T (GeV/c) vs x

P_T (GeV/c) vs z

ϕ_b vs ϕ_s

ϕ_{min} vs ϕ_{max}

Projections

- 3-dimension:
 - Bin in x , z and P_T .
- 60 days running
- Negative charged particle can be collected at the same time.
- With a new kaon PID detector, can provide nice kaon data.

Summary

- The study of k_T -dependent quark distribution (transversity, Sivers function ...) and fragmentation functions (Collins function ...) is an exciting frontier in nuclear physics. Surprising flavor dependence has been observed in Collins and Sivers function.
- The 6 GeV transversity experiments with polarized ^3He target is underway in Hall A to measure the pion SIDIS target single-spin asymmetry on ``neutron'' (kaon data as the by-product).
- 11 GeV prospect for transversity with Solenoid is extremely bright. These experiments will contribute greatly to the worldwide effort on the study of the transversity.
