Experimental studies of N* structure from meson electroproduction data

V.I. Mokeev

Cake Seminar at JLAB Theory Center, November 28 2012
The 6 GeV era came to successful close in May 12’ after fifteen years of running many productive world-class experiments. We are poised to continue our very successful experimental program with CLAS12. CLAS12 will be a unique worldwide facility for exploring strong interaction in the non-perturbative regime.
N* Program with CLAS

• Studies of N* spectrum with a focus in the search for new baryon states
  - baryon state spectrum as rich as it was expected in quark models employing SU(6) spin-flavor symmetry;
  - presence of hybrid baryons with masses above 1.9 GeV.
  bare N* masses were evaluated within the framework of DSEQCD: H.L.L. Roberts, et al., Few Body Syst. 51, 1 (2011):
    - incorporates dynamical chiral symmetry breaking;
    - reproduces N* state ordering.

  - evaluation of pseudo scalar meson photoproduction amplitudes from combined studies of unpolarized cross sections and polarization asymmetries;
  - almost model independent information on N* spectrum, photo and hadronic couplings from singularities of analytical continuation of production amplitudes into a complex energy plane.

• N* structure from exclusive meson electroproduction data
  Extraction of resonance electroexcitation amplitudes ($\gamma\nu NN^*$ electrocouplings) at different photon virtualities $Q^2$.
  Recent review papers:
The studies of nucleon resonance (N*) structure: motivation and objectives

Our experimental program seeks to determine

\( \gamma_v \text{NN}^* \) transition helicity amplitudes (electrocouplings) at photon virtualities 0.2< Q^2<6.0 GeV^2 with CLAS and at 4.0< Q^2<12.0 GeV^2 with CLAS12 detectors for most of the excited proton states through analyzing major meson electroproduction channels independently and in global multi-channel analyses.

This information is needed to study the non-perturbative strong interaction which generates N* states as bound systems of quarks and gluons.

The non-perturbative strong interaction represents the most important part of the Standard Model that we have yet to explore. The non-perturbative strong interaction is far more complex than the electromagnetic and weak interactions and very different in nature.

The Nature of Strong (non-perturbative) QCD regime

\[ \alpha_s(Q^2) = \frac{12\pi}{(33 - 2n_f) \ln \frac{Q^2}{\Lambda^2}} \]

- quark-gluon running coupling \( \alpha_s \) increases with distance
- anti-screening (b) takes over screening (a)
- \( \alpha_s \sim 1 \) as \( Q^2 \rightarrow \) few GeV²

On the same momentum domain, the QCD coupling changes 500,000-times more that the QED coupling and run in the opposite direction.
Particular features of strong interaction in non-perturbative regime

Generation of dressed quarks and gluons

Dressed quarks and gluons acquire dynamical, momentum (distance) dependent masses, structure, and quark-gluon interaction amplitudes.

- Quark/Gluon Confinement
- Dynamical Chiral Symmetry Breaking

Dressing contribution $\sim (\alpha_s)^{N/2}$ (N stands for the number of interaction vertices).
Becomes dominant for the light $u$ and $d$ quarks and gluons as $\alpha_s \sim 1$.

Can not be described within the framework of pQCD!
Dynamical mass and structure of dressed quarks and gluons

• > 98% of dressed quark/gluon and N* masses and their dynamical structure are generated non-perturbatively through dynamical chiral symmetry breaking (DCSB). The Higgs mechanism accounts for less than 2% of the nucleon & N* mass.
• the data from CLAS/CLAS12 will allow us to explore the nature of the dominant part of hadron mass, and will provide access to dressed quark dynamical structure.
• the momentum dependence of the dressed quark mass reflects the transition from quark/gluon confinement to pQCD.

Gluon dynamical mass

S-x Quin et al., PR C84, 042202(R) (2011)
\( \gamma_v NN^* \) electrocouplings as a window to strong interactions in non-perturbative region

Quark core contribution to \( \gamma_v NN^* \) electrocouplings

- Quark propagators are sensitive to the quark running mass \( M(p) \);
- Dressed quark e.m. current is sensitive to the quark dynamical structure;
- Quark interaction vertices \( \Gamma \) and \( X \) are sensitive to the quark non-perturbative interactions.

- Data on \( \gamma_v NN^* \) electrocouplings at different \( Q^2 \) probe momentum dependence of dynamical quark mass, structure, and non-perturbative qq-interactions.

- A key direction in exploration of quark/gluon confinement and DCSB in baryons.
**Why studies of ground and excited nucleon states combined are needed?**

Di-quark content of ground and \( N^* \) states from DSEQCD with vector x vector interaction, C.D.Roberts et al., AIP Conf. Proc. 1432, 309 (2012).

- \( N^* \) states of different quantum numbers offer complementary information on mechanisms of baryon generation from quarks and gluons.
- \( N^* \) electrocouplings allow us to explore strong regime of QCD at larger transverse distances with larger \( \alpha_{QCD} \) than the ground state form factors.
Extraction of $\gamma_v NN^*$ electrocouplings from the data on exclusive meson electroproduction off protons

Resonant amplitudes

Non-resonant amplitudes

N*’s photo-/electrocouplings $\gamma_vNN^*$ are defined at $W=M_{N^*}$ through the N* electromagnetic decay width $\Gamma_\gamma$:

$$\Gamma_\gamma = \frac{Q_{\gamma r}^2}{\pi} \frac{2M_N}{(2J_r + 1)M_{N^*}} \left[ |A_{1/2}|^2 + |A_{3/2}|^2 \right]$$

- Separation of resonant/non-resonant contributions within the framework of reaction models; Breit Wigner ansatz for parameterization of resonant amplitudes; fit of $\gamma_vNN^*$ electrocouplings and hadronic parameters to the data.

- Consistent results on $\gamma_vNN^*$ electrocouplings from different meson electroproduction channels demonstrate reliable extraction of N* parameters.

The approaches for extraction of $\gamma_v NN^*$ electrocouplings from $N\pi$ exclusive electroproduction off protons

The Model based on fixed-t Dispersion Relations (DR)

- the real parts of 18 invariant Ball $N\pi$ electroproduction amplitudes are computed from their imaginary parts employing model independent fixed-t dispersion relations;

- the imaginary parts of the Ball $N\pi$ electroproduction amplitudes at $W>1.3$ GeV are dominated by resonant parts and were computed from $N^*$ parameters fit to the data.

Fits to $\gamma p \rightarrow \pi^+ n$ differential cross sections and structure functions

$Q^2=2.05$ GeV$^2$

- DR
- DR w/o P11
- UIM

$Q^2=2.44$ GeV$^2$

- DR
- UIM

$L=0$ Legendre moments from various structure functions
The CLAS data on $\pi^+\pi^- p$ differential cross sections and their fit within the framework of meson-baryon reaction model JM

G.V. Fedotov et al, PRC 79 (2009), 015204
1.30 $<$ W $<$ 1.56 GeV; 0.2 $<$ Q$^2$ $<$ 0.6 GeV$^2$

W = 1.5125 GeV, Q$^2$ = 0.375 GeV$^2$

M. Ripani et al, PRL 91 (2003), 022002
1.40 $<$ W $<$ 2.30 GeV; 0.5 $<$ Q$^2$ $<$ 1.5 GeV$^2$

W = 1.71 GeV, Q$^2$ = 0.65 GeV$^2$
JM Model Analysis of the $\pi^+\pi^- p$ Electroproduction

Major objectives: extraction of $\gamma \nu NN^*$ electrocouplings and $\pi\Delta$, $\rho p$ decay widths.

$N^*$ contribute to $\pi\Delta$ and $\rho p$ channels only

2$\pi$ direct production
Developed based on approach: I.J.R. Aitchison, Nuclear Physics, A189 (1972), 417.

Inverse of the JM unitarized N* propagator:

\[ S_{\alpha \beta}^{-1} = M_{N*}^2 \delta_{\alpha \beta} - i \sum_i \sqrt{\Gamma_{\alpha i}} \sqrt{\Gamma_{\beta i}} \sqrt{M_{N* \alpha}} \sqrt{M_{N* \beta}} - W^2 \delta_{\alpha \beta} \]

Off-diagonal transitions incorporated into the full resonant amplitudes of the JM model:

\[ S_{11}(1535) \leftrightarrow S_{11}(1650) \]
\[ D_{13}(1520) \leftrightarrow D_{13}(1700) \]
\[ 3/2^+(1720) \leftrightarrow P_{13}(1700) \]

Full resonant amplitude of unitarized Breit-Wigner ansatz is consistent with restrictions imposed by a general unitarity condition, as well as with the resonant Argonne-Osaka ansatz in on-shell approximation.
Resonant /non-resonant contributions from the fit of $\pi^+\pi^- p$ electroproduction cross sections within the JM model

Reliable isolation of the resonant cross sections is achieved

**full cross sections within the JM model**

resonant part

non-resonant part
NΔ Transition Form Factor – $G_M$. Meson-baryon dressing vs Quark core contribution from EBAC-DCC/Argonne-Osaka analysis.

One third of $G^*_M$ at low $Q^2$ is due to contributions from meson–baryon (MB) dressing:

Within the framework of relativistic QM [B.Julia-Diaz et al., PRC 69, 035212 (2004)], the bare-core contribution is very well described by the three-quark component of wave function.

Whether MB-dressing helps us to understand local/global parton-hadron duality?

Could we observe the transition to pQCD in $Q^2$ –range up to 14 GeV$^2$?
The $P_{11}(1440)$ Electrocouplings from the CLAS Data

LF quark models:

---

EBAC-DCC

MB dressing (absolute values).

1. Consistent values of $P_{11}(1440)$ electrocouplings determined in independent analyses of $N\pi$ and $\pi^+\pi^-p$ exclusive channels strongly support reliable electrocoupling extraction.

2. The physics analyses of these results revealed the $P_{11}(1440)$ structure as a combined contribution of:  

   a) quark core as a first radial excitation of the nucleon $3$-quark ground state and 

   b) meson-baryon dressing.

\[ A_{1/2}^{\pi^+\pi^-p} \text{ vs } Q^2 \text{ GeV}^2 \]

\[ S_{1/2}^{\pi^+\pi^-p} \text{ vs } Q^2 \text{ GeV}^2 \]
Evaluation of $P_{11}(1440)$ electrocouplings within Dyson-Schwinger Equation of QCD (DSEQCD)

- First evaluation from QCD of quark core contribution to $P_{11}(1440)$ electrocouplings.
- Evidence for substantial contributions from meson-baryon cloud in particular at $Q^2 < 1.0$ GeV$^2$.
- Evaluation with vector x vector interaction and momentum dependent quark mass function are in progress.

$A_{1/2}$ vs $Q^2$ GeV$^2$

- DSEQCD.
- Parameterization of the EBAC-DCC bare electrocouplings.
- Meson-baryon dressing EBAC-DCC (abs. values).

- Poincare-covariant, symmetry preserving DSEQCD evaluation.
- Account for quark mass/structure formation in dressing of bare quark by gluon cloud.
- Simplified contact interaction generates momentum independent quark mass.

$$g^2 D_{\mu\nu} (p-q) \Rightarrow \delta_{\mu\nu} \frac{4\pi \alpha_{IR}}{m_G^2}$$

$$\frac{\alpha_{IR}}{4\pi} = 0.93 \quad m_G = 0.8 \text{GeV}$$

$$m_q^{\text{bare}} = 0.007 \text{GeV} \Rightarrow m_q^{\text{dressed}} = 0.368 \text{GeV}$$

- Evidence for substantial contributions from meson-baryon cloud in particular at $Q^2 < 1.0$ GeV$^2$. 
Transition $N-P_{11}(1440)$ form factors in LQCD

Includes the quark loops in the sea, which are critical in order to reproduce the CLAS data at $Q^2<1.0$ GeV$^2$

$A_{1/2}, S_{1/2} \Rightarrow F_1^*, F_2^*$

$M_{\pi} = 390, 450, 875$ MeV

$L$ box $= 3.0, 2.5, 2.5$ f

• Exploratory LQCD results provide reasonable description of the CLAS data from the QCD Lagrangian.

• Prospects for LQCD evaluation with improved projection operators, approaching physical $m_{\pi}$ in the box of appropriate size.
The $D_{13}(1520)$ electrocouplings from the CLAS data

- A reasonable agreement between the results from $N\pi$ and $\pi^+\pi^-p$ exclusive channels.
- Contributions from 3 dressed quarks in the first orbital excitation and MB cloud combined.
- Direct access from experimental data on $A_{1/2}$ electrocoupling at $Q^2>2.0$ GeV$^2$ to quark core with negligible contribution from MB cloud.

Evidence for chiral symmetry breaking from $Q^2$-evolution of the ground state and $S_{11}(1535)$ parity partner form factors

In chiral symmetry limit:

$$-F_1(Q^2) = (-Q^2) G_1(Q^2) = F_1^*(Q^2);$$

$$F_2(Q^2) = -\frac{(M + m) m}{\kappa} G_2(Q^2) = F_2^*(Q^2);$$

$1/2 + \rightarrow 1/2$ transitio n current :

$$J_\mu = (-Q^2 \gamma_\mu - q_v \gamma^\nu q_\mu) G_1(Q^2) - \frac{1}{2} (M + m) i \sigma^{\mu\nu} q_v G_2(Q^2)$$

$M, m$ are $S_{11}(1535)$ and proton masses, $k = 1.79$

$F_1^*, F_2^* \rightarrow S_{11}(1535)$ form factors from the CLAS data

parameterization of elastic Dirac $F_1$ and Pauli $F_2$ form factors

Evaluation of $F_1^*$ and $F_2^*$ starting from QCD within the framework of

Light Cone Sum Rule & LQCD.

Update: LCSR at NLO is in progress

High lying resonance electrocouplings from the $\pi^+\pi^- p$ CLAS data analysis

The $N\pi$ world

$N\pi\pi$ CLAS from independent fits of 3 $W$-intervals

$N\pi$ $Q^2=0$, CLAS

- The $\pi^+\pi^- p$ electroproduction channel provided first preliminary results on $S_{31}(1620)$, $S_{11}(1650)$, $F_{15}(1685)$, $D_{33}(1700)$, and $P_{13}(1720)$ electrocouplings of a good accuracy.
- Information on electrocouplings of most $N^*$ with $M_{N^*}<1.8$ GeV is available and will be extended in few years up to $Q^2=5.0$ GeV$^2$. 
  
\[ \Delta(1700)D_{33} \]

\[ N(1720)P_{13} \]
CLAS12 supports a broad program in hadronic physics.

Plans to study excited baryons and mesons:

- Search for hybrid mesons and baryons
- Spectroscopy of $\Xi^*$, $\Omega^-$
- $N^*$ Transition form factors at high $Q^2$. 

CLAS12
\[ \gamma^*_v \text{NN}^* \text{ Electrocouplings: A Unique Window into the Quark Structure} \]

**Meson-Baryon Dressing**

- absolute meson-baryon cloud amplitudes (EBAC)
- quark core contributions (constituent quark models)

Data on \[ \gamma^*_v \text{NN}^* \] electrocouplings from E12-09-003 experiment (\( Q^2 > 5 \text{ GeV}^2 \)) will afford for the first time direct access to the non-perturbative strong interaction among dressed quarks, their emergence from QCD, and the subsequent N* formation.
Electromagnetic form factors are sensitive to the running quark masses and their dynamical structure. 12 GeV experiment E12-09-003 will extend access to transition FF for all prominent N* states in the range up to $Q^2 = 12$ GeV$^2$.

Probe the transition from confinement to pQCD regimes, allowing us to explore how confinement in baryons emerge from QCD and how >98% of baryon masses are generated non-perturbatively via dynamical chiral symmetry breaking.
$\gamma_{vNN^*}$ Electrocoupling Sensitivity to Momentum Dependent Quark Mass & Structure

colored point with error bars:
available CLAS results on $A_{1/2}$ electrocoupling of $P_{11}(1440)$

\[ \pi^+\pi^-p \quad \pi^+\pi^-p \quad N\pi \]

CLAS12 projected

quark core contribution estimated within:
- LF quark model which employs momentum dependent mass of pointlike quark ($F_1=1, F_2=0$)
  I.G. Aznauryan and V.D.Burkert
- DSE with contact $qq$-interaction and momentum independent mass function
- DSE expectation for QCD $qq$-interaction and momentum dependent mass function

$\gamma_{vNN^*}$ electrocouplings measured at the $Q^2 > 5.0\text{GeV}^2$ are sensitive to momentum dependence of dressed quark mass and structure.
Conclusions and outlook

• Data on $\gamma_vNN^*$ electrocouplings of most excited proton states in mass range $M_{N^*} < 1.8$ GeV are available from analyses of the CLAS meson electroproduction data at photon virtualities $Q^2 < 5.0$ GeV$^2$ from single meson and at $Q^2 < 1.5$ GeV$^2$ from double pion electroproduction channels. The files with numerical results can be requested from V.Mokeev (mokeev@jlab.org).

• The CLAS results on $\gamma_vNN^*$ electrocouplings offer new opportunity for hadron structure theory to explore how non-perturbative strong interaction generate excited proton states of different quantum numbers.

• In the future (few years time scale):
  • $\gamma_vNN^*$ electrocoupling of $N^*$ states with $M > 1.6$ GeV will become available from $N\pi$ channels;
  • $\gamma_vNN^*$ electrocoupling of most excited proton states in mass range up to 2.0 GeV and at photon virtualities up to 5.0 GeV$^2$ will become available from analysis of $\pi^+\pi^-p$ electroproduction;
Conclusions and outlook

- contributions of $\pi^-\Delta^{++}$, $\pi^+\Delta^0$, $\pi^+D_{13}(1520)$, $\pi^+F_{15}(1685)$ and $\rho p$ channels to nine 1-fold $\pi^+\pi^-p$ cross sections can be obtained from the CLAS data in DIS area (2.0<$W<$3.0 GeV, 2.0<$Q^2<$5.0 GeV$^2$), if they can be used for extraction of transition $p\rightarrow N^*$ GPD’s and/or for extending our knowledge on diagonal GPD’s from $\rho p$ exclusive electroproduction;
- two-body $\pi^-\Delta^{++}$, $\pi^+\Delta^0$, $\pi^+D_{13}(1520)$, $\pi^+F_{15}(1685)$ and $\rho p$ cross sections in terms of CM angular distributions at different masses of unstable hadron can be obtained from $\pi^+\pi^-p$ cross sections for subsequent extraction of these channel amplitudes, employing amplitude analysis methods;
- resonant contributions to meson electroproduction amplitudes can be provided for the studies of global and local duality.

• The CLAS12 detector is the only foreseen worldwide facility, which will be capable to explore N* electrocouplings at largest photon virtualities ever achieved 5.0<$Q^2<$12 GeV$^2$. For the first time, we will be able to explore regime of quark core dominance, probe momentum dependence of dressed quark mass function in the transition from confinement to pQCD regime and to explore how >98 % of hadron mass in the Universe are generated via dynamical chiral symmetry breaking and how confinement in baryons emerges from QCD.
Back-up
Impact of the Recent LQCD studies of N* Spectrum and Structure on the N* Program with CLAS/CLAS12

• each N* state with $M_{N^*} < 1.8$ GeV has partner in computed LQCD spectrum, but level ordering is not always consistent to the data.

• wave functions of the low-lying N* states dominate by 1-2 SU(6) configurations, while the wave function of high lying N*'s may contain many SU(6) configurations.

• presence of hybrid-N*s with dominant contribution of hybrid components at $M_{N^*} > 1.9$ GeV marked by

New direction in N* studies proposed in V.D.Burkert, arXiv:1203.2373 [nucl-ex]:
Search for hybrid N*-states looking for:
➢ overpopulation of SU(6)-multiplet;
➢ particular behavior of $\gamma_N N^*$ electrocouplings, which reflects presence of the hybrid component.

Should be verified by experiment!
### Evidence for new N* states and couplings

More than 85% of meson electroproduction data worldwide were obtained in experiments with the CLAS detector and available in the CLAS Physics Data Base: [http://clasweb.jlab.org/physicsdb/](http://clasweb.jlab.org/physicsdb/)
$S_{11} (1535)$ electrocouplings and their interpretation

Analysis of $p\eta$ channel assumes $S_{1/2}=0$

Branching ratios: $\beta_{N\pi} = \beta_{N\eta} = 0.45$

- $A_{1/2} (Q^2)$ from $N\pi$ and $p\eta$ are consistent
- First extraction of $S_{1/2}(Q^2)$ amplitude

- LQCD & LCSR calculations (black solid lines) by Regensburg Univ. Group reproduces

Subject for our Workshop:
Prospects for evaluation of $\gamma NN^*$ electrocouplings for other pairs of $N^*$ parity partners; access to quark distribution amplitudes in $N^*$ states of different quantum numbers.
Signals from N* states in the CLAS KY electroproduction data

D. Carman, private communication

\[ C_l = \int \left\{ \frac{d\sigma}{d\theta_{K^*}} + \varepsilon \frac{d\sigma}{d\theta_{K^0}} \right\} P_l(z) d(-z) \]

\[ z = \cos(\theta_K) \]

the structures in W-dependencies of C_l – moments at the same W-values in all Q^2-bins are consistent with the contributions from resonances of spin-parities listed in the plots.

reaction model(s) are needed for extraction of N* parameters from KY electroproduction.
Anticipated N* Electrocouplings from data on N\(\pi\) & N\(\pi\pi\) electroproduction

Open circles represent projections and all other markers the available results with the 6-GeV electron beam.

- Examples of published and projected results obtained within 60d for three prominent excited proton states from analyses of N\(\pi\) and N\(\pi\pi\) electroproduction channels. Similar results are expected for many other resonances at higher masses, e.g. S\(_{11}(1650)\), F\(_{15}(1685)\), D\(_{33}(1700)\), P\(_{13}(1720)\), …

- This experiment will – for the foreseeable future – be the only experiment that can provide data on \(\gamma_vNN^*\) electrocouplings for almost all well established excited proton states at the highest photon virtualities ever achieved in N* studies up to \(Q^2\) of 12 GeV\(^2\).
Reaction Models for Extraction of $\gamma_vNN^*$ Electrocoupling at $Q^2>5.0$ GeV$^2$

• All current reaction models for extraction of $\gamma_vNN^*$ electrocouplings employ meson-baryon degrees of freedom. They can be applied at $Q^2<5.0$ GeV$^2$, where meson-baryon mechanisms are most relevant.

• The models explicitly account for the transition from meson-baryon to quark degrees of freedom are needed for extracting of $\gamma_vNN^*$ electrocouplings from N$\pi$ and N$\pi\pi$ electroproduction data at $5.0<Q^2<12.0$ GeV$^2$ and $W<2.0$ GeV.

The starting point:

   Description of non-resonant mechanisms in $\pi^+n$, $\pi^0p$, $\pi\Delta$, and $\rho p$ electroproduction channels with the full coverage of reaction phase, including:
   ➢ hand-bag diagrams with GPD’s structure function from DIS studies;
   ➢ reggeized meson-baryon amplitudes;
   ➢ color dipole
   ➢ others……….

Most urgent need for $\gamma_vNN^*$ electrocoupling studies with the CLAS12!

Time scale:
Should be ready by 2015, when E-12-09-003 experiment is scheduled to start the collection of N$\pi$ and N$\pi\pi$ electroproduction data
The contribution of $\pi^-\Delta^{++}$, $\pi^+\Delta^0$, $\pi^+D_{13}(1520)$, $\pi^+F_{15}(1685)$ and $\rho p$ channels to nine 1-fold $\pi^+\pi^-p$ cross sections (kind of shown in the slide #16) can be obtained in the future at $2.0<W<3.0\ GeV$ and $2.0<Q^2<5.0\ GeV^2$.

Would it be possible to use these results for extraction of transition $\pi\rightarrow\Delta$, $p\rightarrow D_{13}(1520)$, $p\rightarrow F_{15}(1685)$ GPD’s and diagonal $p\rightarrow p$ GPD from $\rho p$ exclusive channel?

Two-body $\pi^-\Delta^{++}$, $\pi^+\Delta^0$, $\pi^+D_{13}(1520)$, $\pi^+F_{15}(1685)$ and $\rho p$ cross section at different fixed running masses of unstable hadron can be determined from available $\pi^+\pi^-p$ cross sections. Is it possible to use “data” on these two body angular distribution for reconstruction of these channel amplitudes?
