

C200 Project: Thermal Curing scheme for Lead-glass Calorimeter

Tao Ye

Stony Brook University

June, 2016, HUGS

- a R&D project of Super Bigbite Program
 - Electromagnetic calorimeter(EMCal): TF1 lead-glass
 - ~ 200 EMCal: $\sim 10\%$ of the full detector.

- a R&D project of Super Bigbite Program
 - Electromagnetic calorimeter(EMCal): TF1 lead-glass
 - ~ 200 EMCal: $\sim 10\%$ of the full detector.
- Super-Bigbite Program
 - Form factor measurements: G_E and G_M at high Q^2
 - Ready by the end of 2017

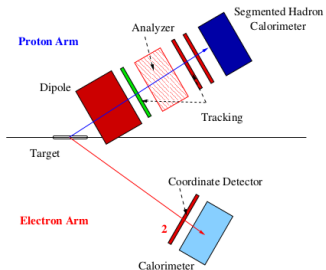

- a R&D project of Super Bigbite Program
 - Electromagnetic calorimeter(ECal): TF1 lead-glass
 - ~ 200 ECals: $\sim 10\%$ of the full detector.
- Super-Bigbite Program
 - Form factor measurements: G_E and G_M at high Q^2
 - Ready by the end of 2017
- Featuring
 - High luminosity capability 10^{38} s/cm²
 - Small scattering angle, down to 3.5°
 - Large solid angle, up to 70 msr
 - Gas Electron Multiplier(GEM) chamber

High Q^2 measurements for form factor

Super-Bigbite: Apparatus

- A Dipole magnet: from BNL
- Tracking detector: using GEM
- Coordinate Detector
- Hadron/electronmagnetic calorimeters

Electromagnetic Calorimeters for G_E^p

- TF1 Lead-glass :
4cm*4cm*40cm
- Cherenkov radiator from
electron shower (γ)
- ECal: measures position/energy
of incident particle

*NIM A 248 (1986) 86-102

Radiation damages

- Radiation damages: Darkening of lead-glass
 - decreases transparency
 - degrades energy resolution
- ECal for G_E^P requires curving under high dose radiation rate.
- UV curing is inefficient under high dose rate

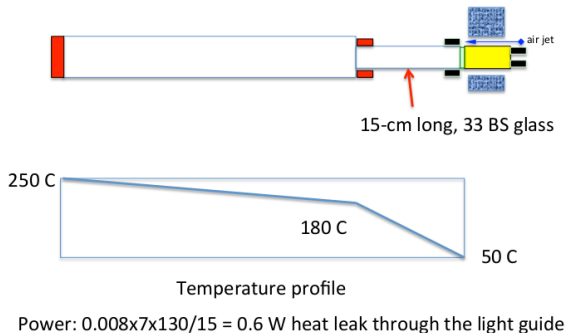

2015 DOE review

Implementation of an ECAL annealing scheme on the scale of the full detector assembly will take some further R&D which poses some risk. The C200 prototype test appears to be a reasonable next step...

Goals

- searching for a damages curing method for running continuously
- test it on a detector with ~ 200 ECal elements

Curing Scheme

A desired temperature distribution

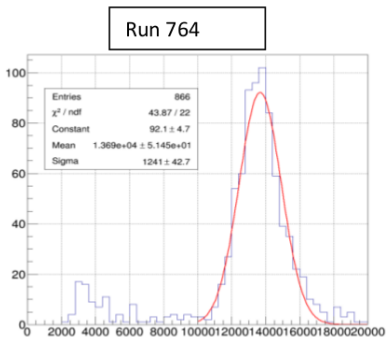

- ~ 250 °C on lead-glass
- ~ 50 °C on PMTs

C16 prototype

- 4×4 blocks of ECals.

C16: Beam test

- Before: 9.1% , After(heating):9.7%
- C16: a proof-of-principle for heat annealing
- Next step - C200: to understand what is required for full scale

C200 Design

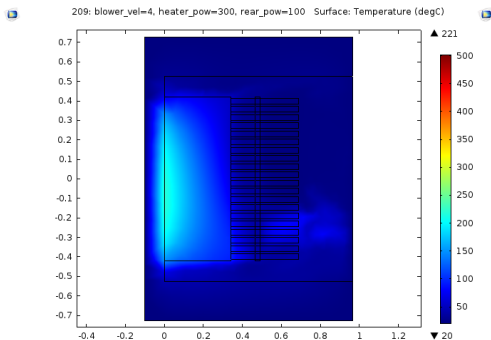

C200 Design

C200 Design

C200: COMSOL Simulation

- Desired temperature profile is achieved.
- C200 is being assembled
- Guided with simulation results, a test run will start at this summer.

C200: COMSOL Simulation

C200 Temperature Profile

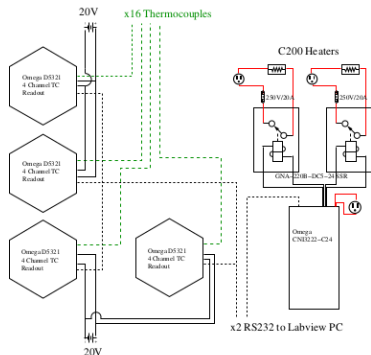

209: blower_vel=4, heater_pow=300, rear_pow=100 Surface: Temperature (degC)

- Desired temperature profile is achieved.
- C200 is being assembled
- Guided with simulation results, a test run will start at this summer.

C200: Data Acquisition and Control modules

- 16 thermal couples + readout modules
- Control : temperature control + solidstate relay

Summary

- As a fraction of Super-Bigbite program, C200 offers a lot of interesting challenges to be solved.
- C16 provides a proof of thermal curing method
- C200 prototype will tests the operation at large scale
