

HyCal Trigger Efficiency

Victor Tarasov

PRIMEX note 73

August 2013

1 Trigger Efficiency

One component of π^0 detection efficiency is HyCal trigger efficiency. HyCal trigger was generated in case if total energy deposition in HyCal exceeded certain value. The goal of this analysis is to extract probability of HyCal trigger to appear in case if we have certain energy deposition in HyCal, which is the definition of HYCAL trigger efficiency (as a function of deposited in HYCAL energy).

Trigger efficiency was obtained from 2nd Snake Scan data.

The following cuts were applied to select data for analysis:

- 1) exactly one hit in TRIGTHIT bank with id=1 (MOR) and time within $\pm 20\text{ns}$

$banks \rightarrow TRIGTHIT \rightarrow trigthit[i].id == 1;$

$abs(banks \rightarrow TRIGTHIT \rightarrow trigthit[i].t) < 20;$

- 2) exactly one cluster in calorimeter with energy between 0.8 and 8.0 GeV

$banks \rightarrow HYCALCLUSTER \rightarrow bank.nrow == 1;$

$0.8 \text{ GeV} < banks \rightarrow HYCALCLUSTER \rightarrow hycalcluster[i].E < 8.0 \text{ GeV};$

- 3) exactly one reconstructed TAGGER hit within $\pm 20\text{ns}$ time

$banks \rightarrow TAGM_LR \rightarrow bank.nrow == 1;$

$abs(banks \rightarrow TAGM_LR \rightarrow tagm_lr[i].t) < 20;$

- 4) cluster energy corresponds tagger energy

$abs(cluster_energy/tagger_energy - 1) < 0.1;$

- 5) HyCal energy corresponds cluster energy

$energy_hcal - E_cl < 0.20 \text{ GeV};$

One hit in TRIGTHIT bank with id=2 and time within 20 ns was a condition for existence of HyCal trigger signal.

Most of channels have inefficiency less 0.1% when energy greater than 4.0 GeV. But several of them have reduced information in the data. On fig 1. presented HyCal

matrix with these channels (pointed yellow). For channels #1535-1540 expected run file primex2_065126.dat doesn't exist. Most files in runs 61119-65122 which expected to have statistics in channels #1647, 1681-1685, 1715-1719 are junked. For other “yellow” marked channels cut $|1 - E_{Cluster}/E_{Tagger}| < 0.1$ doesn't work, because used π^0 calibration constants are different from snake calibration constants. So we changed gain factors to made calibration for these channels. Typical uncalibrated channel presented on fig. 2. In fig. 3 presented inefficiency for “good”(1100) and “bad”(1690) channel for comparison. In figures 4 and 5 presented inefficiency for channels (1571 and 1637) with enhanced inefficiency.

Problem channels

Channel	Description of problem
1571	reduced efficiency ~ 99.4%
1637	reduced efficiency ~ 70%
1690	Dead dynode

Channels with shifted gains

1521, 1525, 1527, 1528, 1563, 1594, 1629, 1630, 1631, 1731, 1821, 1857, 1858, 2132

Channels with low statistics

1526, 1630 (channels near the central hole)
 1335-1340 (should be in file primex2_065126.dat which were missed)
 1647, 1681-1684, 1715-1719 (should be in files in runs #65119-65122 which are mostly junk)

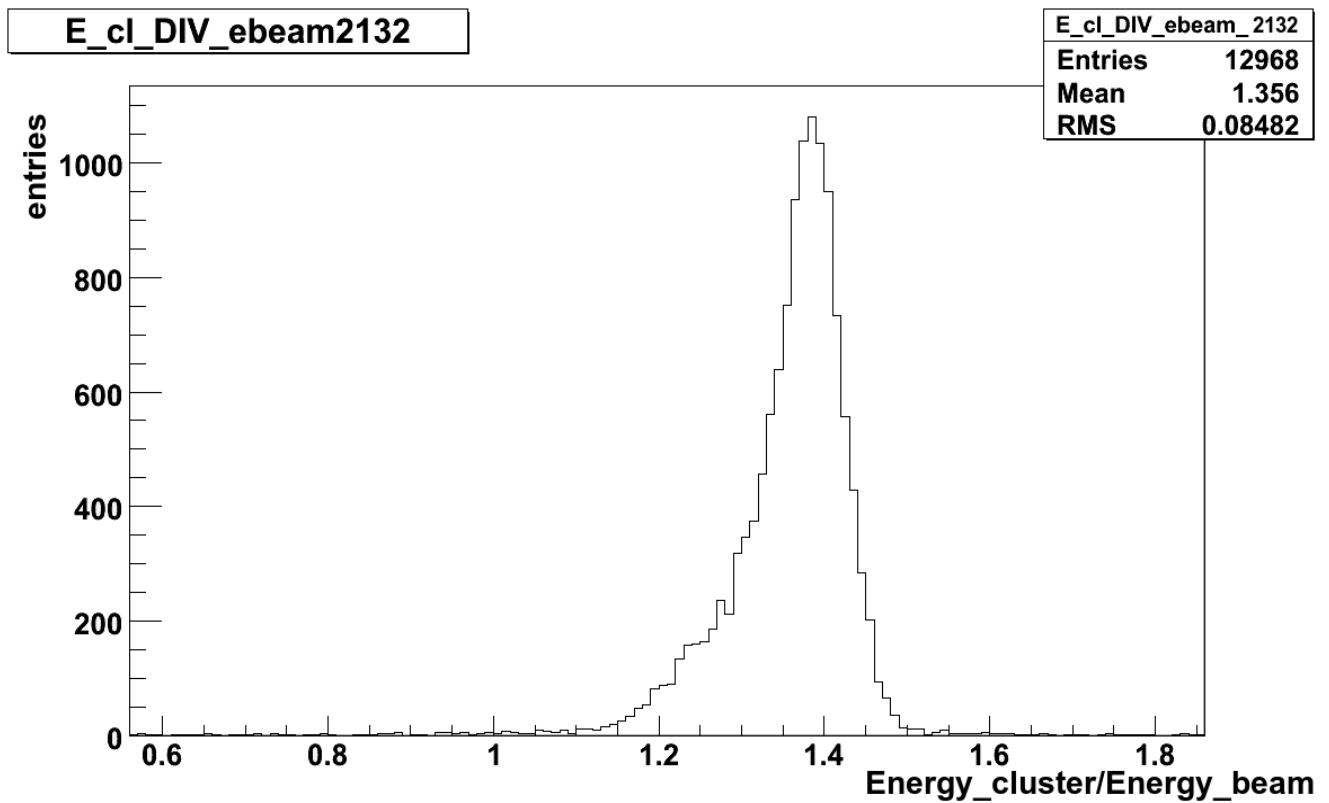

Fig. 2. Example of energy ratio spectrum with “shifted gain” (channel #2132)

In fig. 6-11 presented inefficiency for all channels for energy range 3.4÷3.7 GeV, 3.7÷4.0 GeV, 4.0÷4.3 GeV, 4.3÷4.6 GeV, 4.6÷4.9 GeV, 4.9÷5.2 GeV, 5.2÷5.5 GeV correspondingly. Channels with greater inefficiency marked with red color.

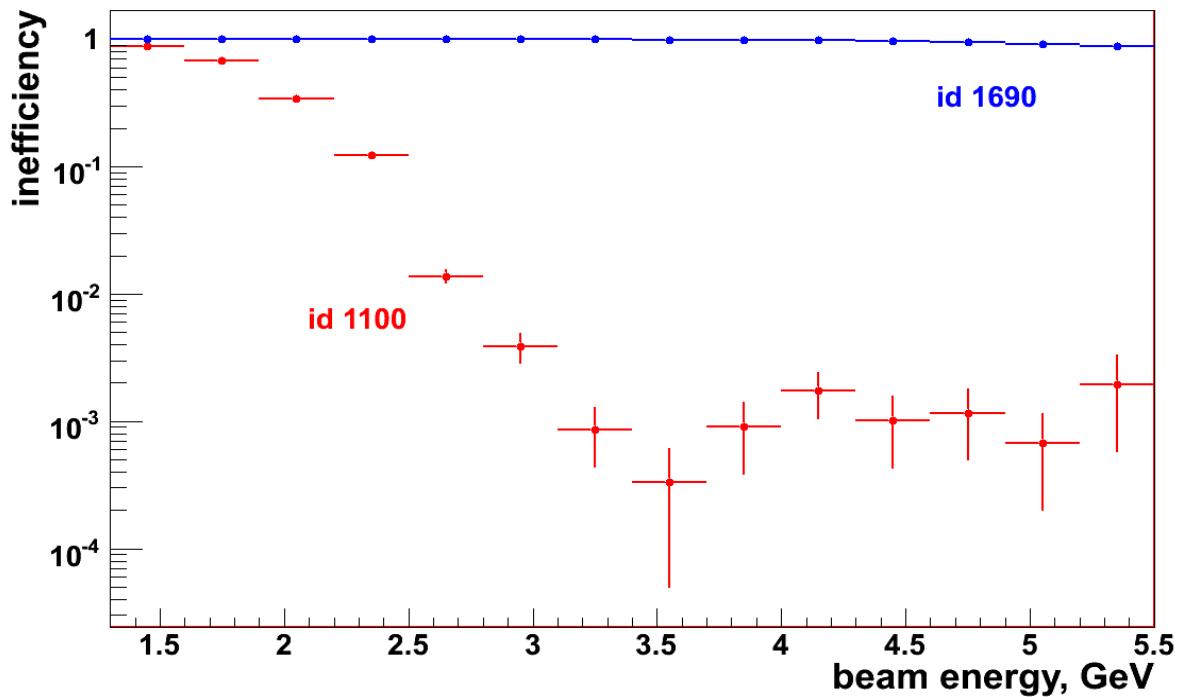

Fig. 3. Inefficiency of HyCal trigger as a function of energy for problem channel #1690 in compare with good channel #1100

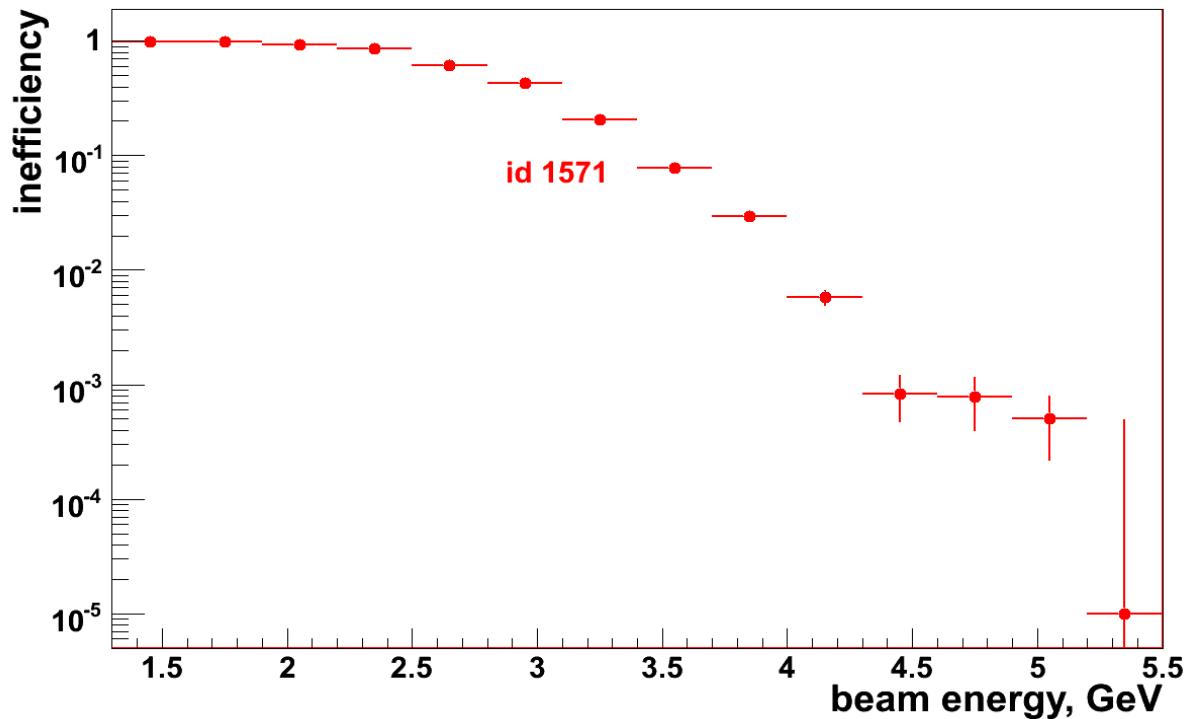

Fig. 4. Inefficiency of HyCal trigger as a function of energy for problem channel #1571

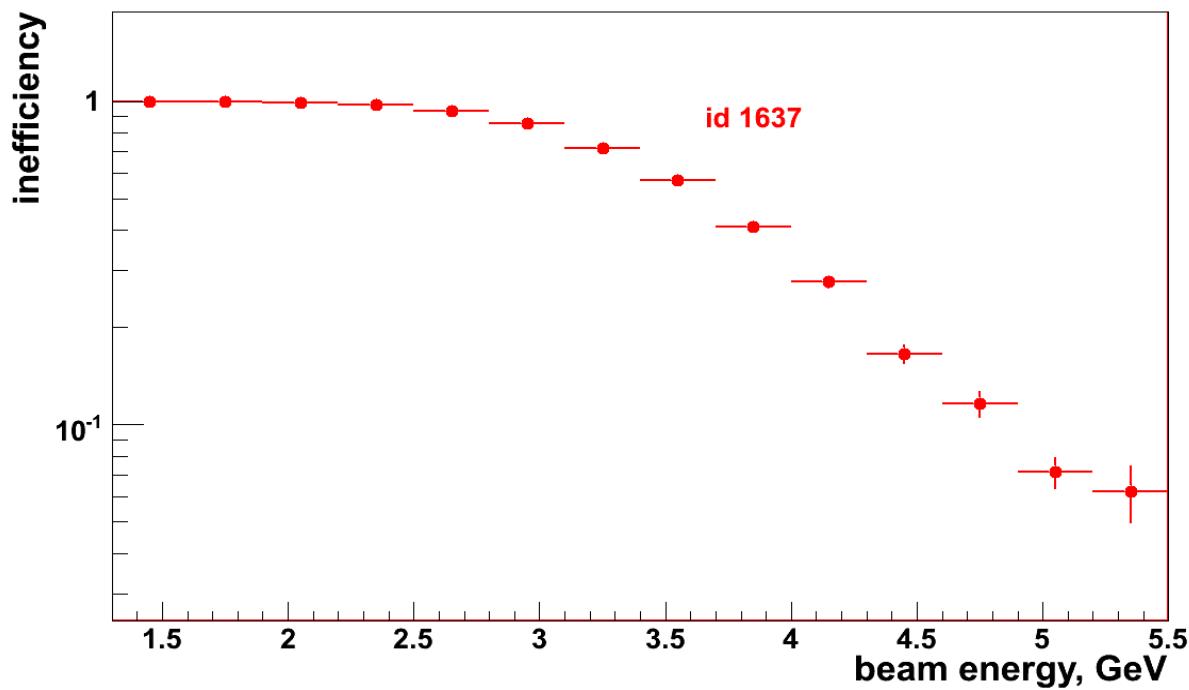

Fig. 5. Inefficiency of HyCal trigger as a function of energy for problem channel #1637

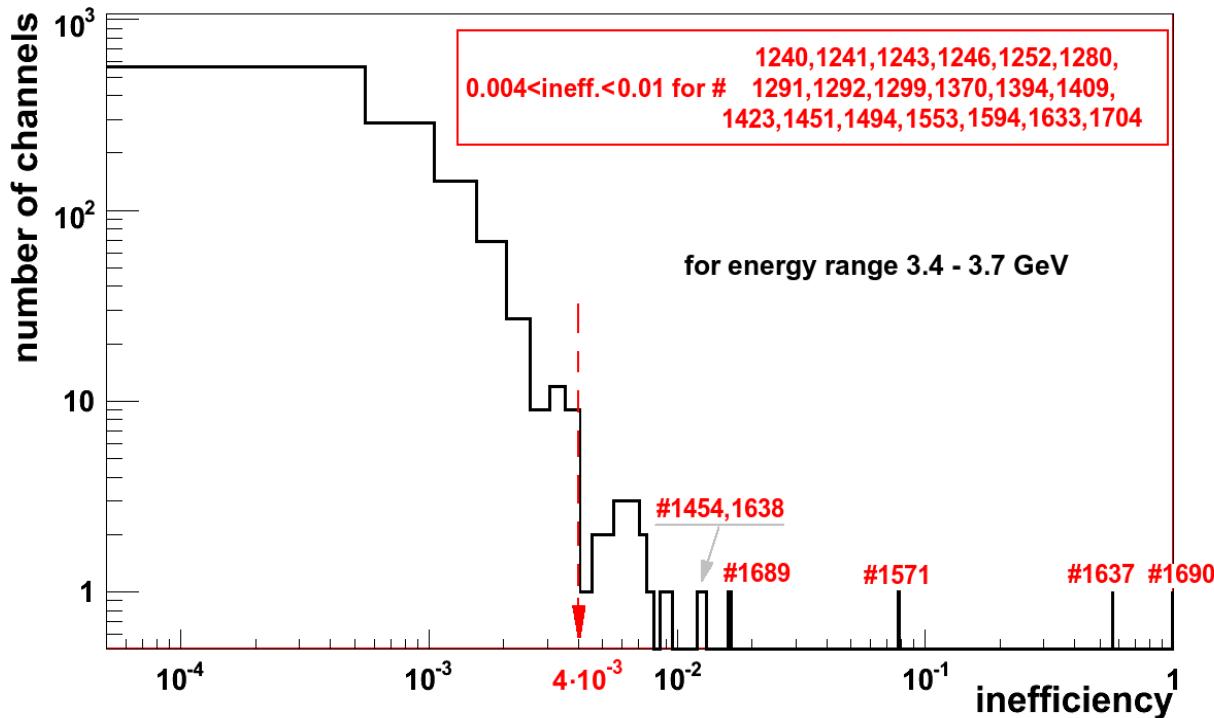

Fig. 6. Number of channels versus inefficiency for energy range 3.4-3.7 GeV

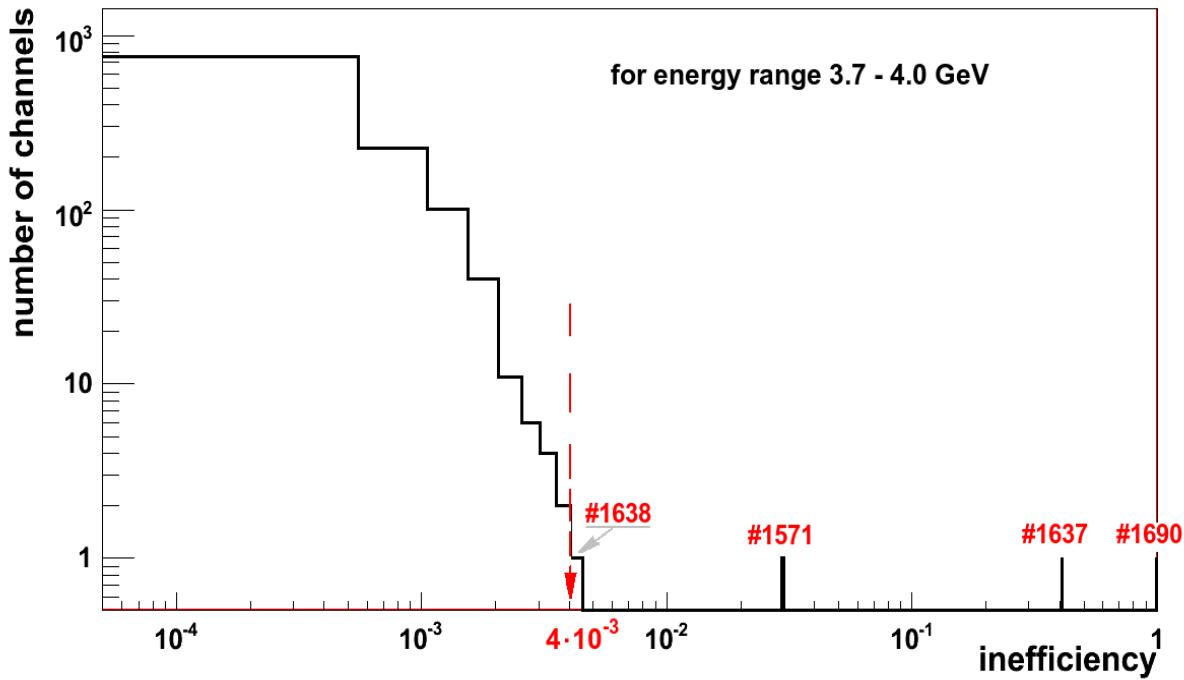

Fig. 7. Number of channels versus inefficiency for energy range 3.7-4.0 GeV

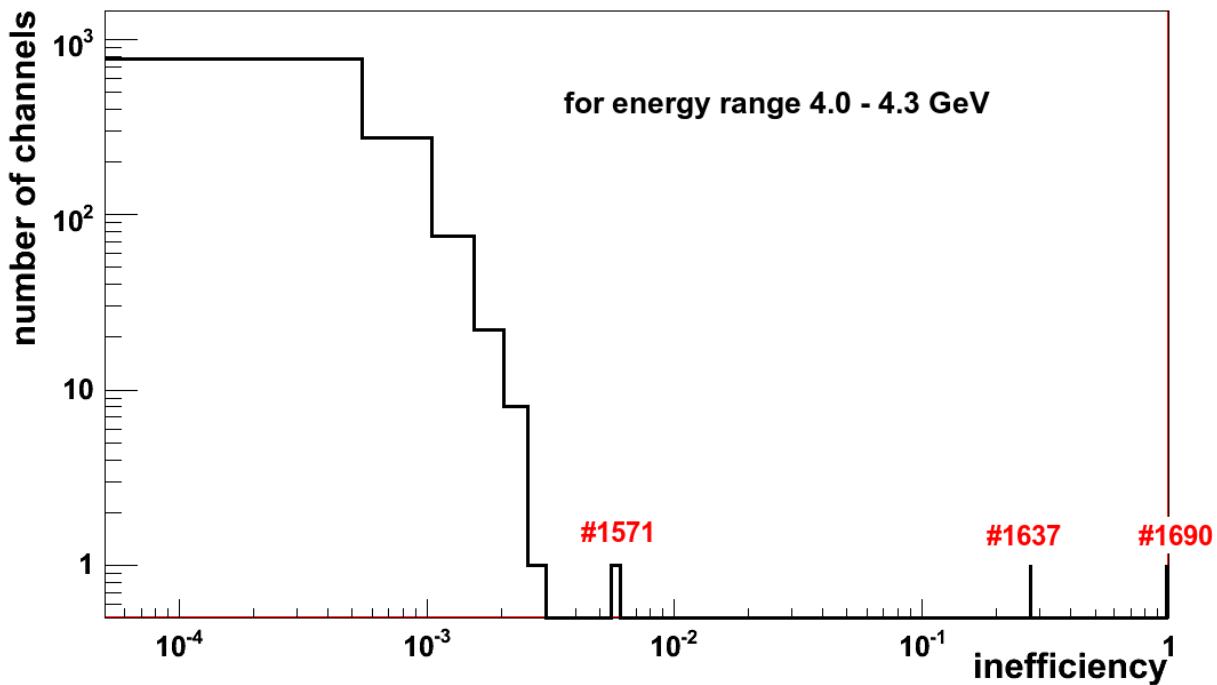

Fig. 8. Number of channels versus inefficiency for energy range 4.0-4.3 GeV

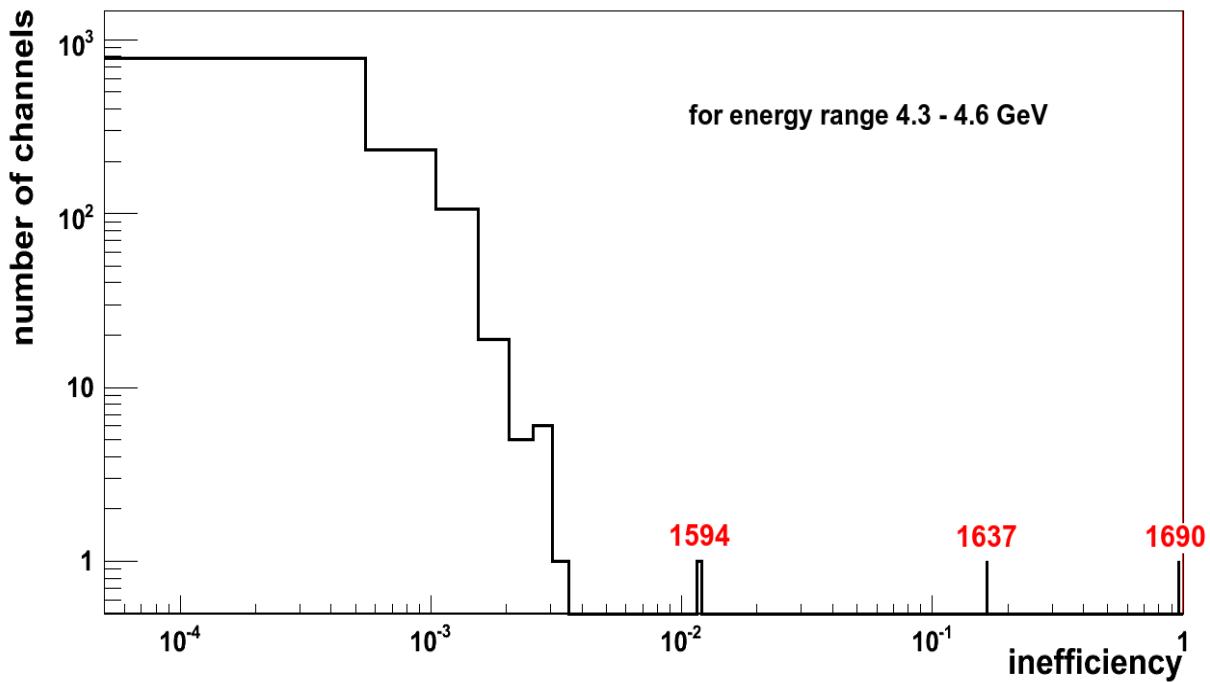

Fig. 9. Number of channels versus inefficiency for energy range 4.3-4.6 GeV

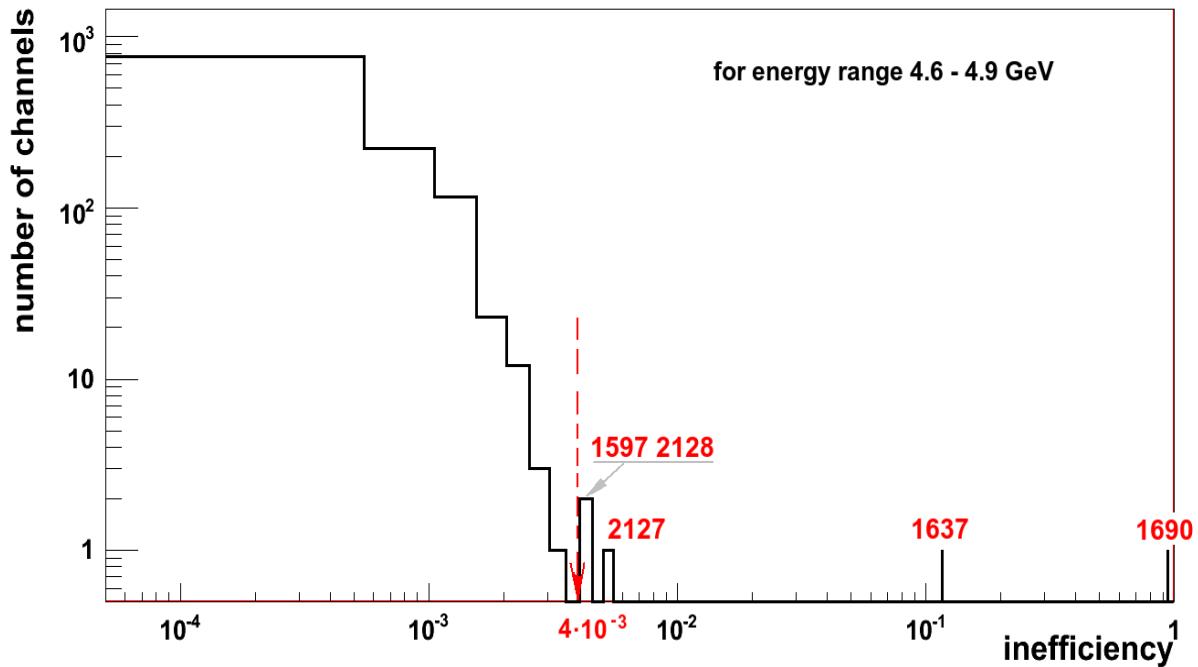

Fig. 10. Number of channels versus inefficiency for energy range 4.6-4.9 GeV

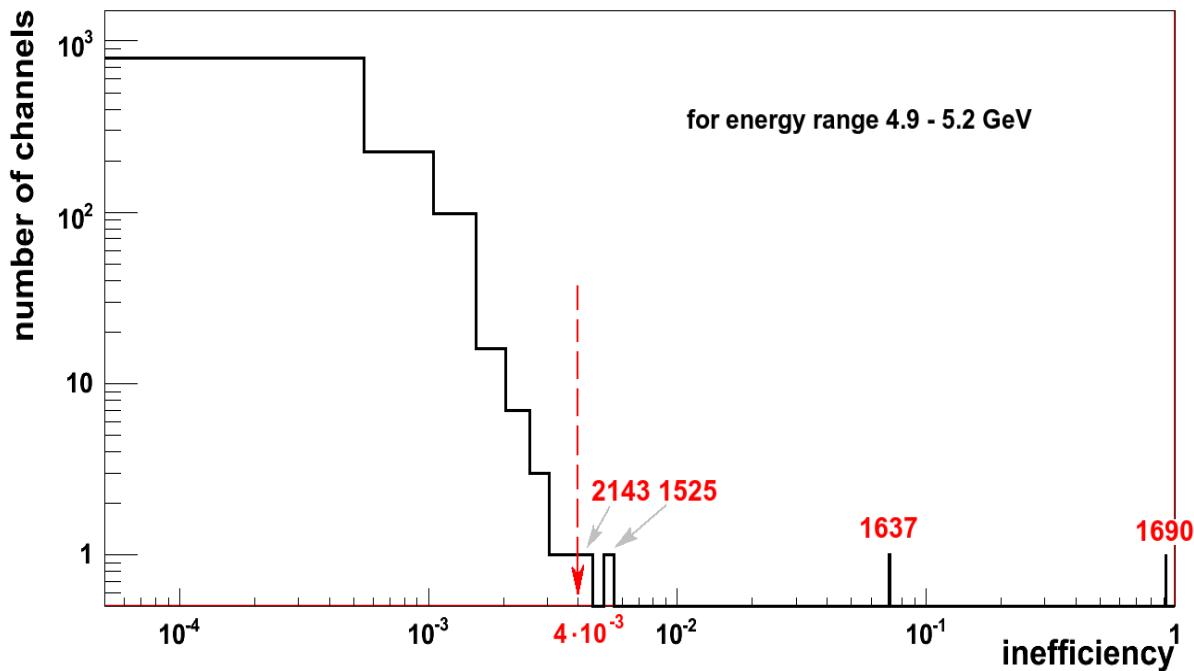

Fig. 11. Number of channels versus inefficiency for energy range 4.9-5.2 GeV

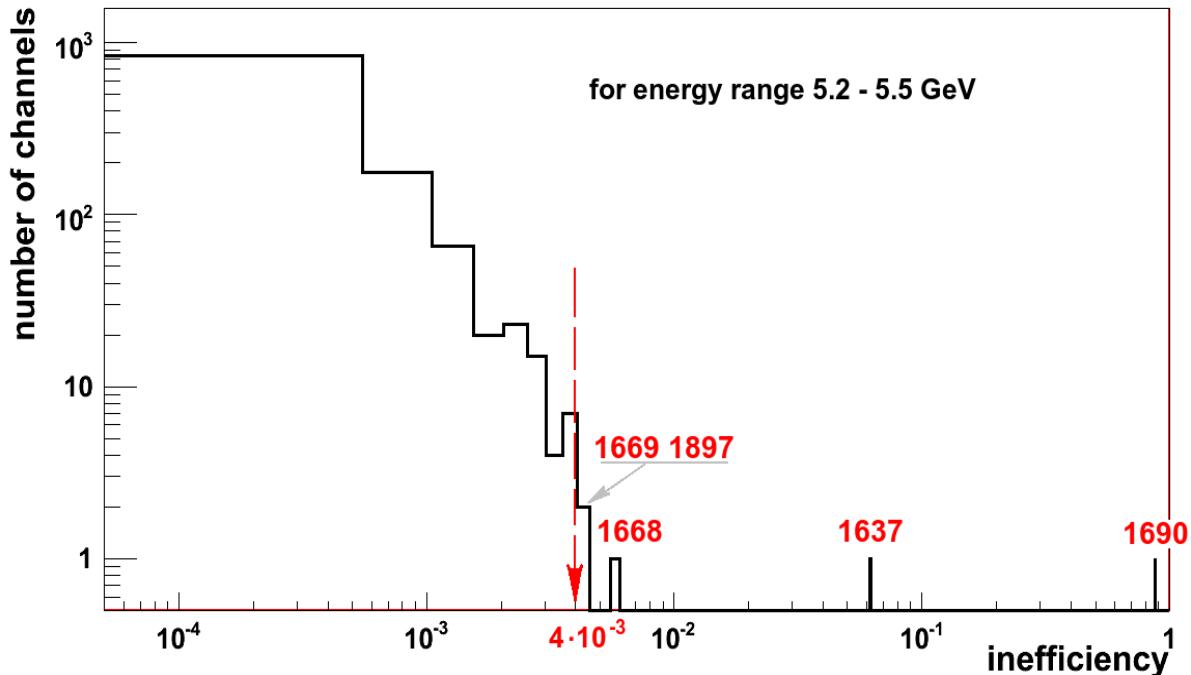

Fig. 12. Number of channels versus inefficiency for energy range 5.2-5.5 GeV

2 Timing study

Typical distribution of time difference between reconstructed TAGGER hit (from TAGM_LR) and HYCAL trigger (from TRIGTHIT) presented on fig. 13. This distribution presented when beam was focused on channel number #1418 and high energy range (T1-19).

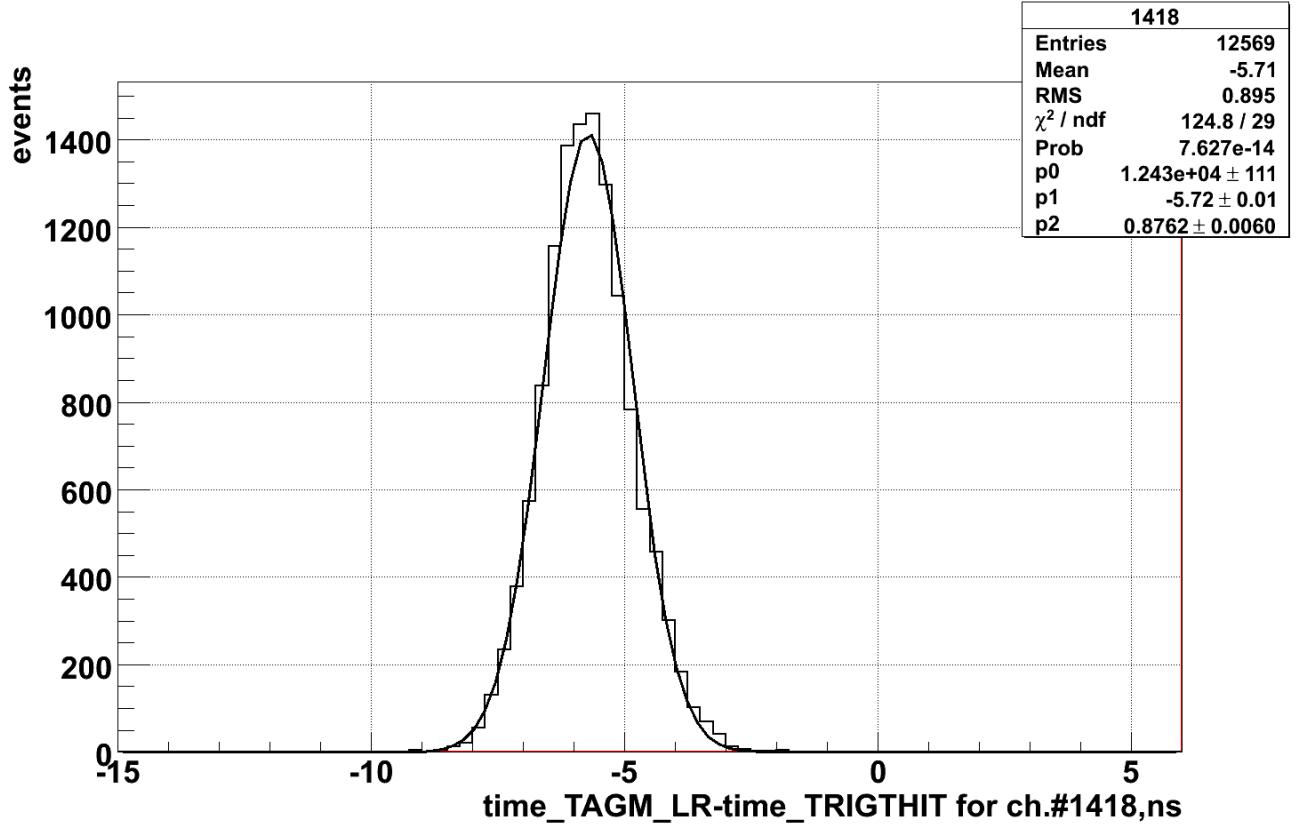

Fig. 13. Time difference (time TAGM_LR – time TRIGTHIT) for channel #1418 T1-19

Distribution was fitted with Gauss function: p0 – number of events, p1 – mean and p2 – sigma.

In fig. 10 presented distribution of peak center position for all channels (1001-2156) excluding 5 channels with no or too low statistics (1561, 1562, 1595, 1596 – central zone and 1528 which were excluded from analysis). Channels #1832 and #1690 marked red, because their values are far from mean time difference. In fig. 15 are shown errors of peak center positions for each channel. It is seen that most of errors have value not greater than 0.03ns and only several ones (channel with dead dynode #1690 and channels with low statistics 1336-1340) have values from 0.1 to 0.35 ns. In fig. 16 and 17 presented distributions for sigma value and error of sigma. Channels which have bigger than regular sigma value marked with red color. Errors here are negligible (most of them are under 0.03ns).

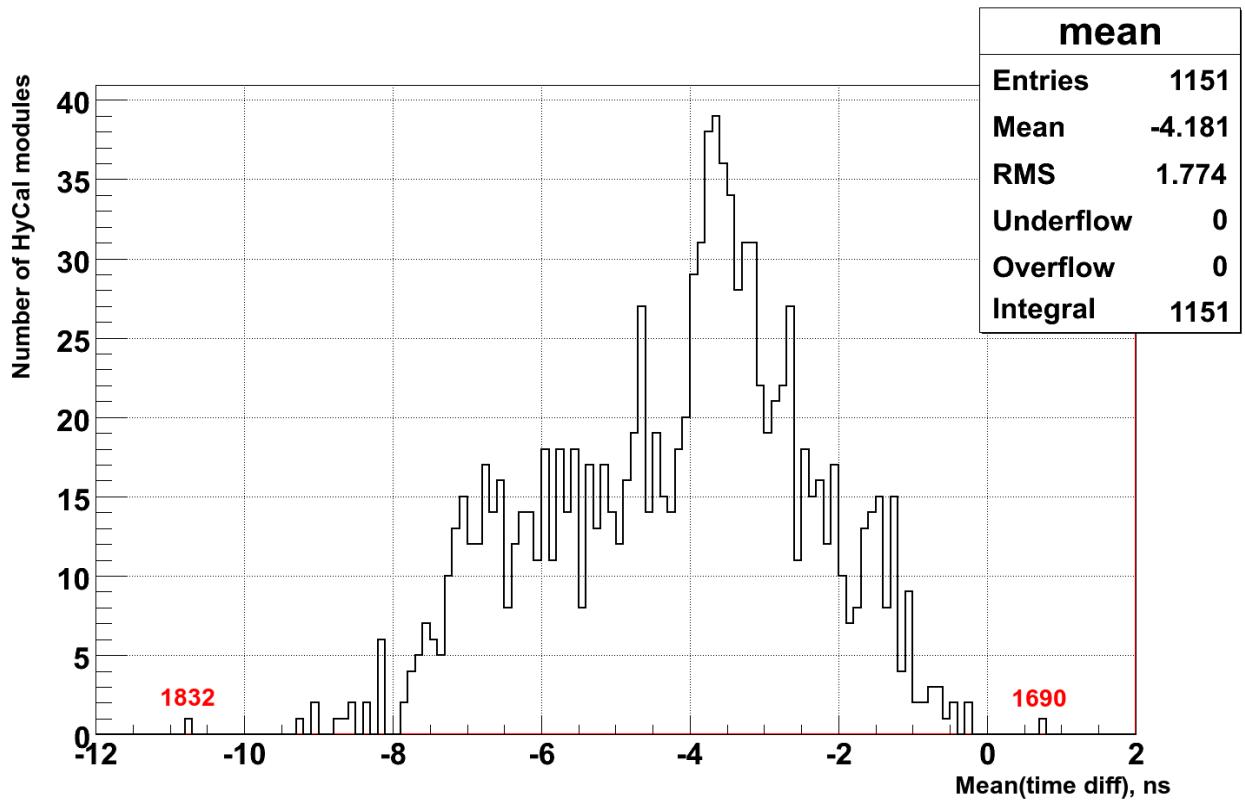

Fig. 14. Mean value of time difference from fit (TAGM_LR time – TRIGTHIT time)

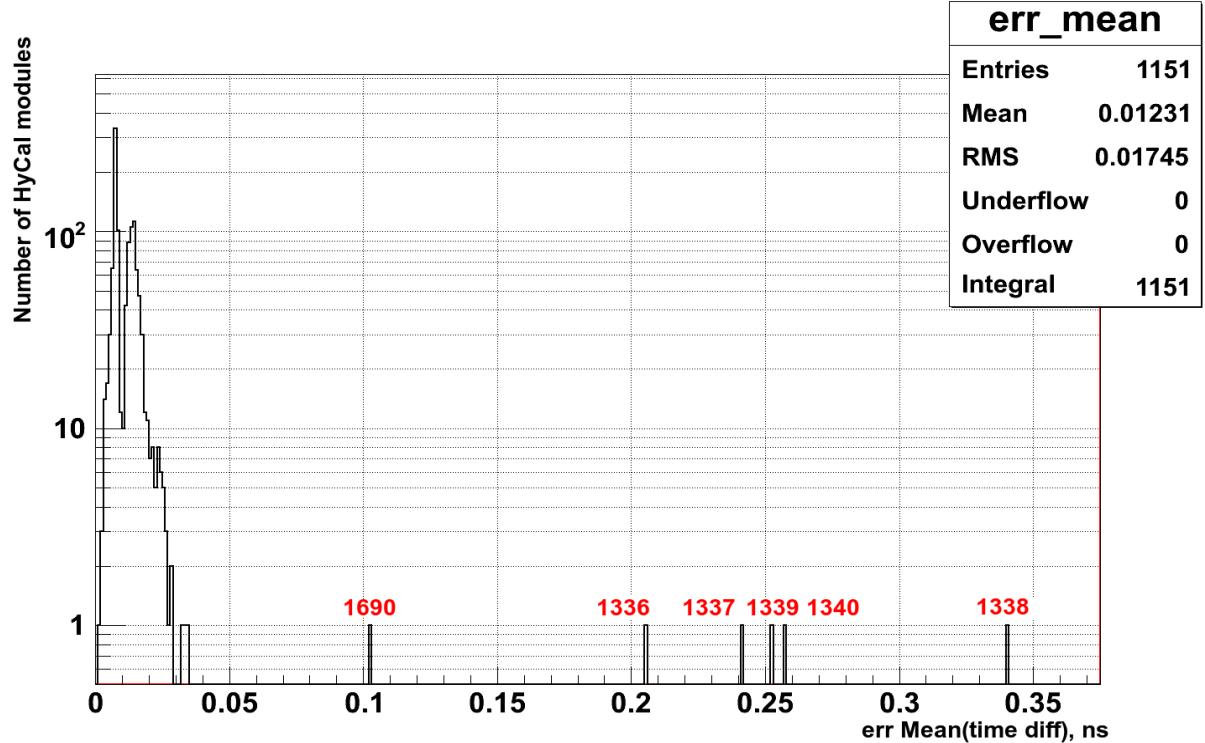

Fig. 15. Error of mean value from fit

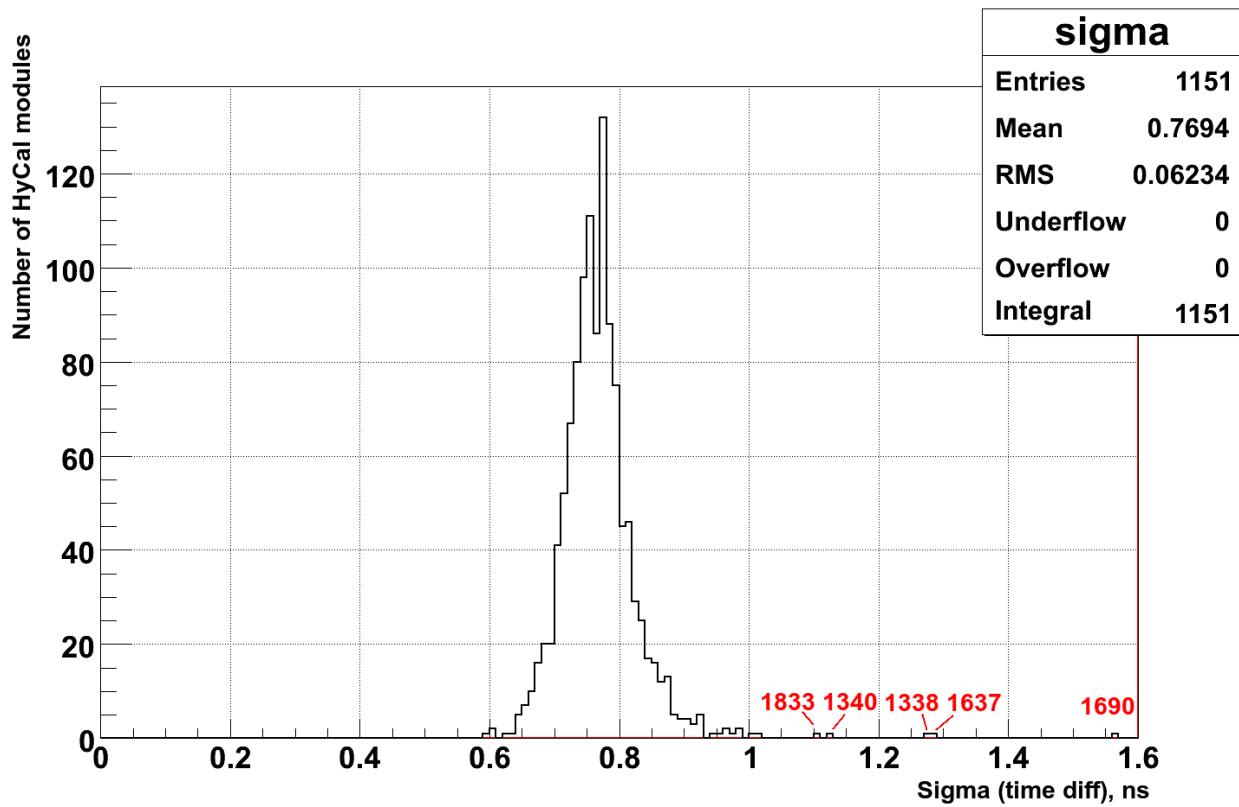

Fig. 16. Sigma value of time difference from fit (TAGM_LR time – TRIGTHIT time)

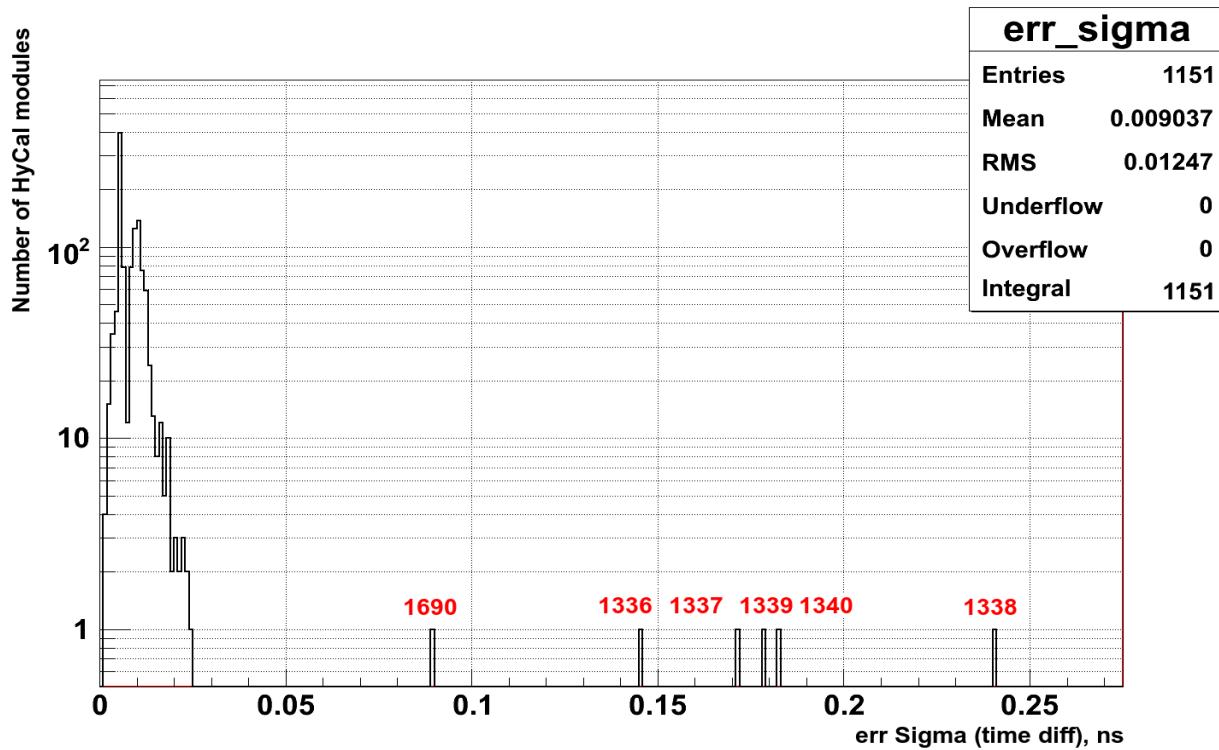

Fig. 17. Error of sigma value from fit

In fig. 18 presented available statistics for each channel (for T counters 1-19).

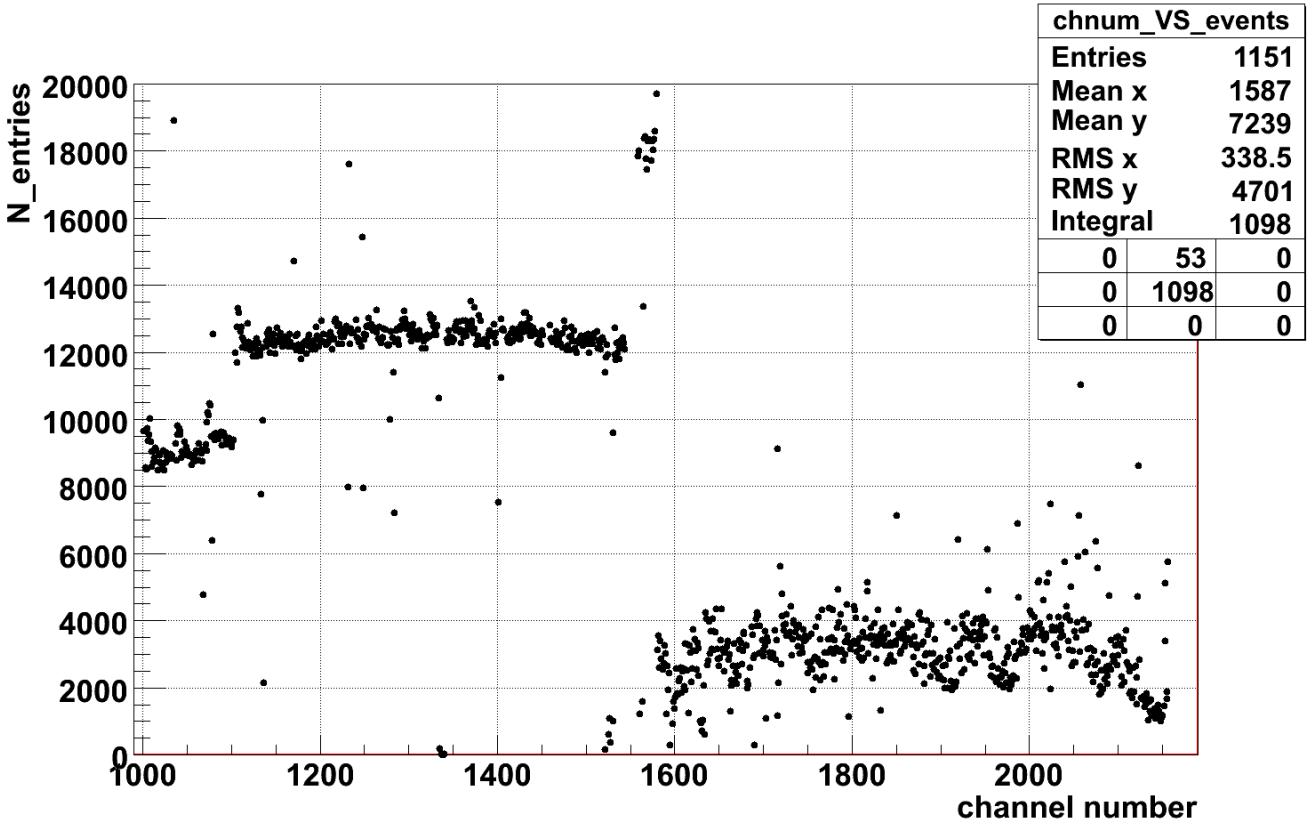

Fig. 18 Dependence between number of entries and channel number

It is seen from picture that at some points (around channel number 1100 and 1550) we had enhance and drop in statistics (if we take into consideration that beam went from bigger numbers to smaller numbers of channels, we need to look at this picture reverse). At the beginning of snake scan run was available short statistics and then at some point statistics was enhanced.

Summary

Inefficiency for the HyCal Totalsum trigger for energies greater than 4.0 GeV was found to be $\leq 0.1\%$ for majority of channels except for some problem ones: 1571, 1637, 1690 (for channel 1571 inefficiency is about 0.6%, for channel 1637 is about 30%). Channel 1690 has a dead dynode therefore we are not triggering from this module at all.

That means that we can use value of 0.1% as an upper estimation of trigger deviation from 100% (estimation of HyCal Totalsum trigger efficiency).

Position and width (and their errors) of HyCal trigger peak (time diff: TAGM_LR time – HYCAL TRIGGER time) have been obtained for each PWO module during 2nd Snake Scan for high energy T-counters. This information can be used for calculation of

tdif cut efficiency and it's error. We loaded this data into PrimEx online DB:
 $system = crystal$; $attribute = tdiff_mean, tdiff_mean_err, diff_sigma, tdiff_sigma_err$
For channels with no information we put sigma = -1.

also these values are presented below:

#chan.	entries	mean	err_mean	sigma	err_sigma
