

Parton Distributions from Boosted Fields in the Coulomb Gauge

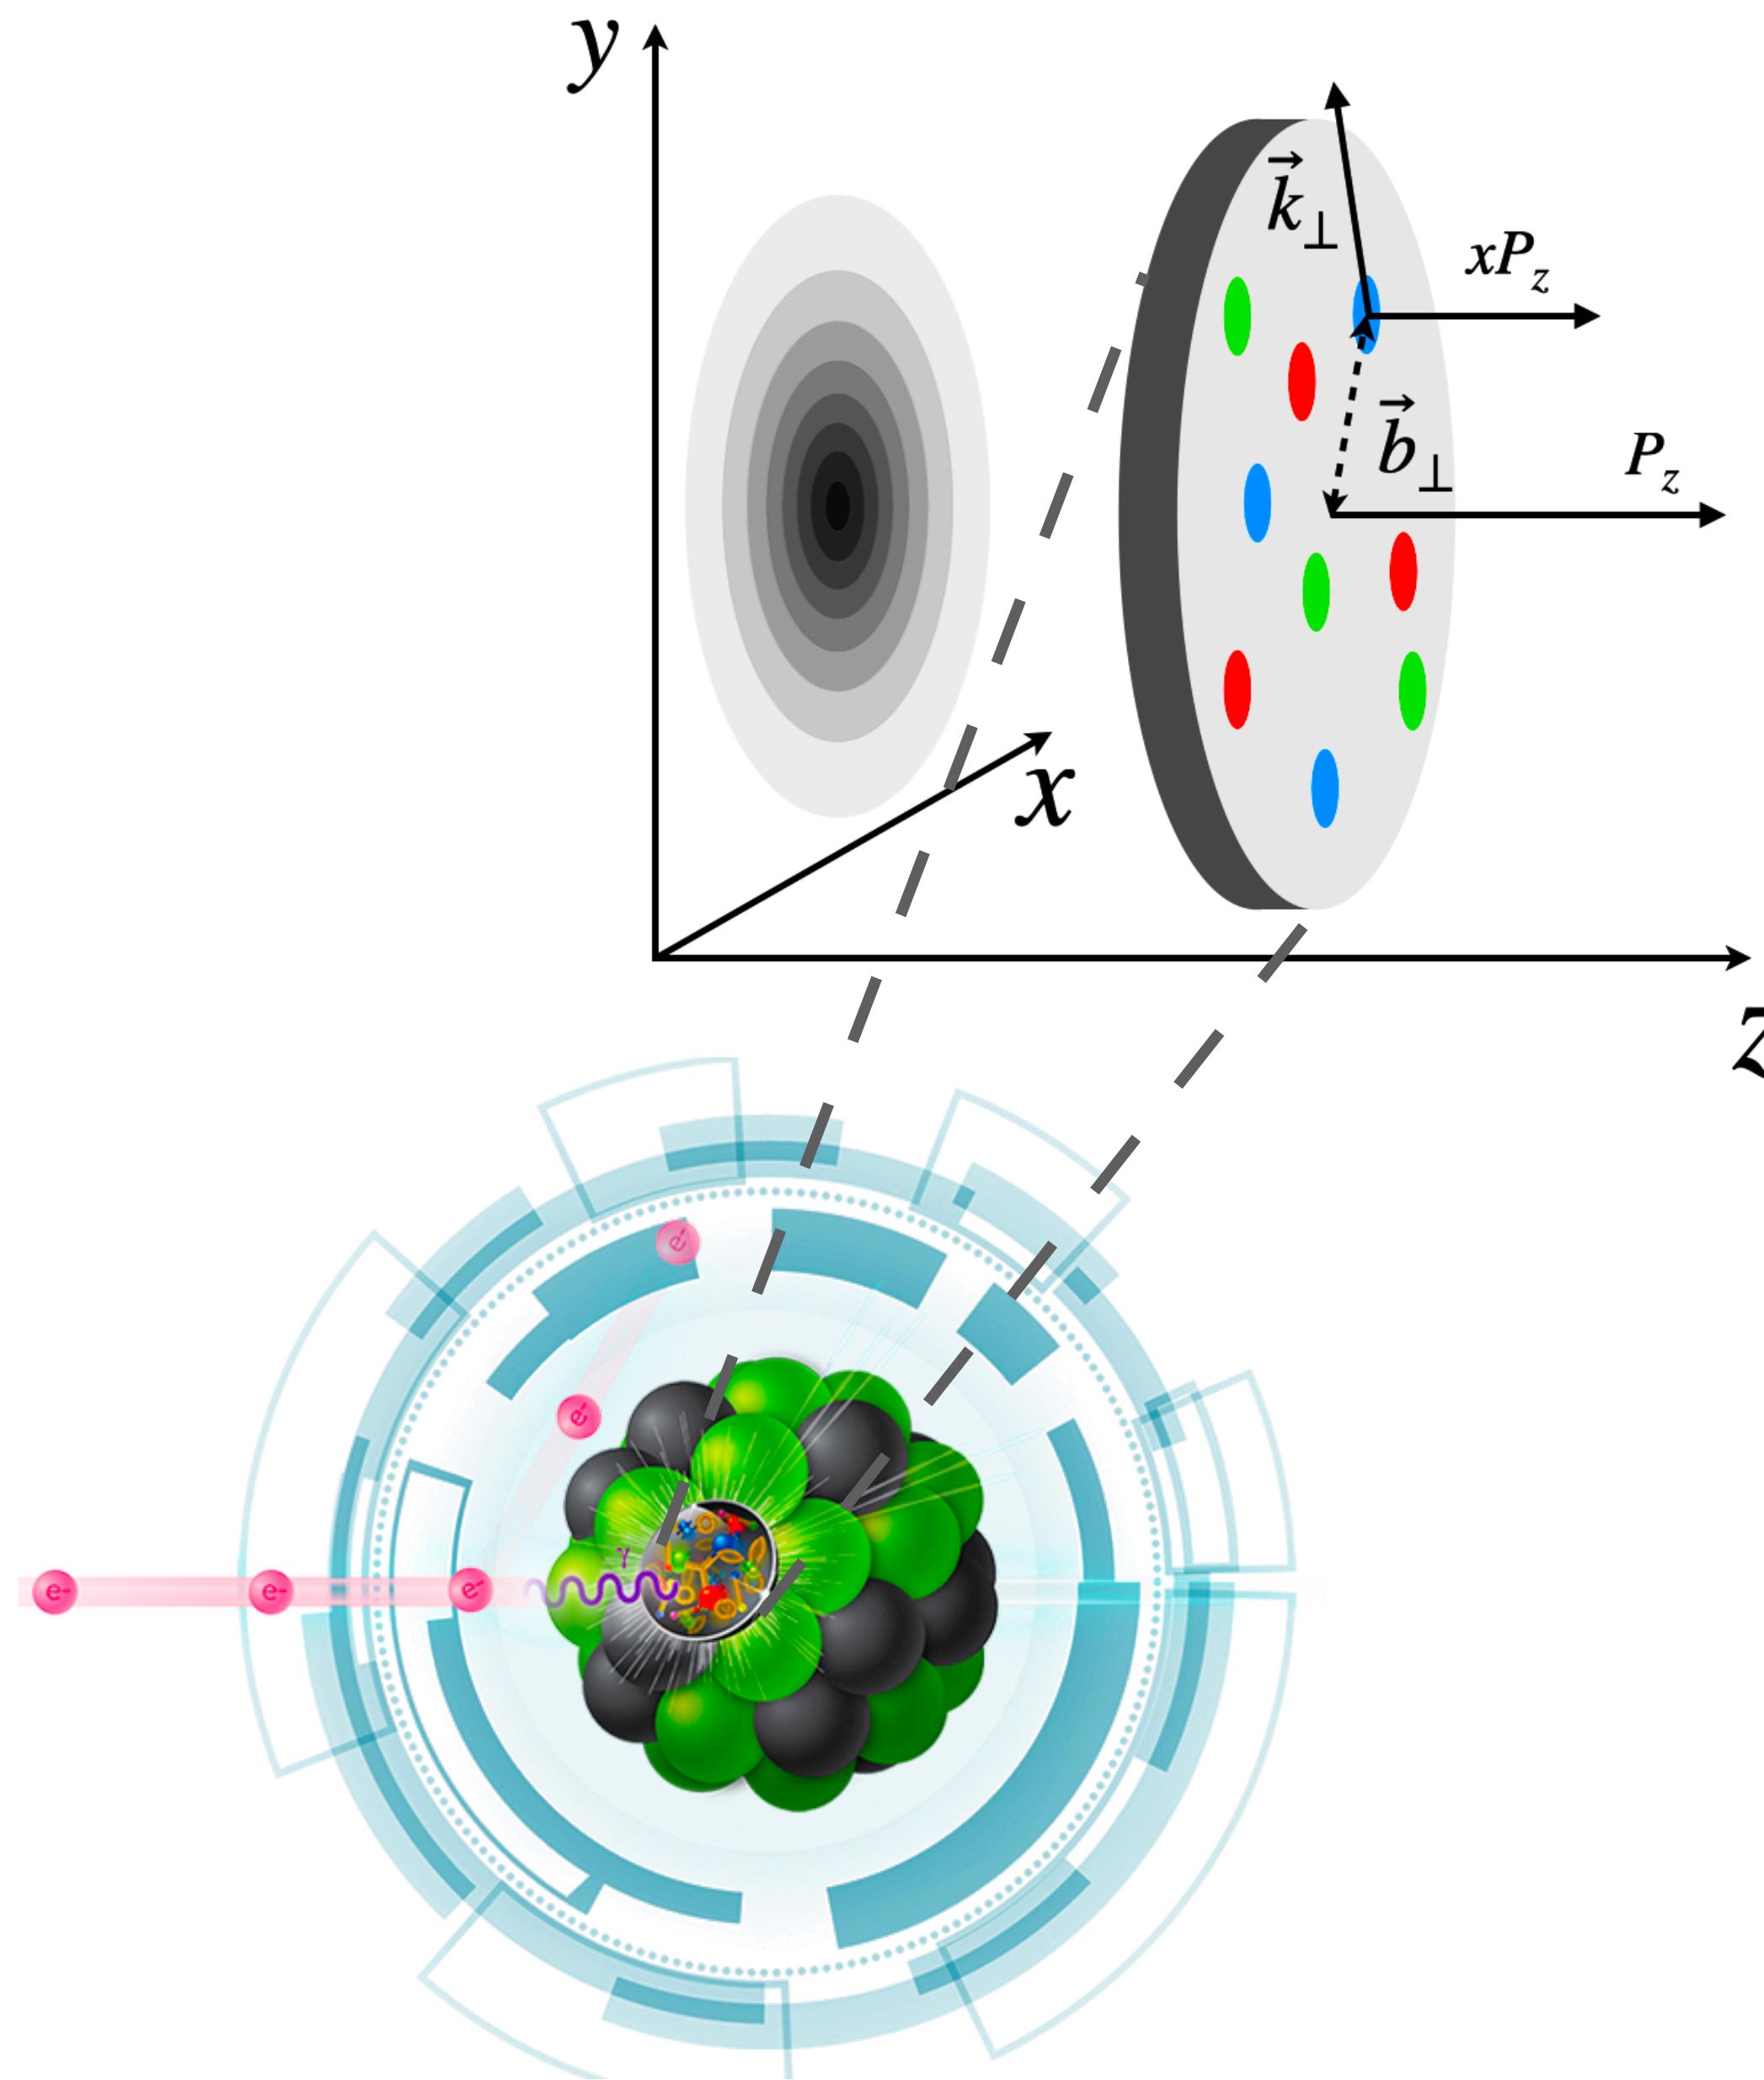

Xiang Gao

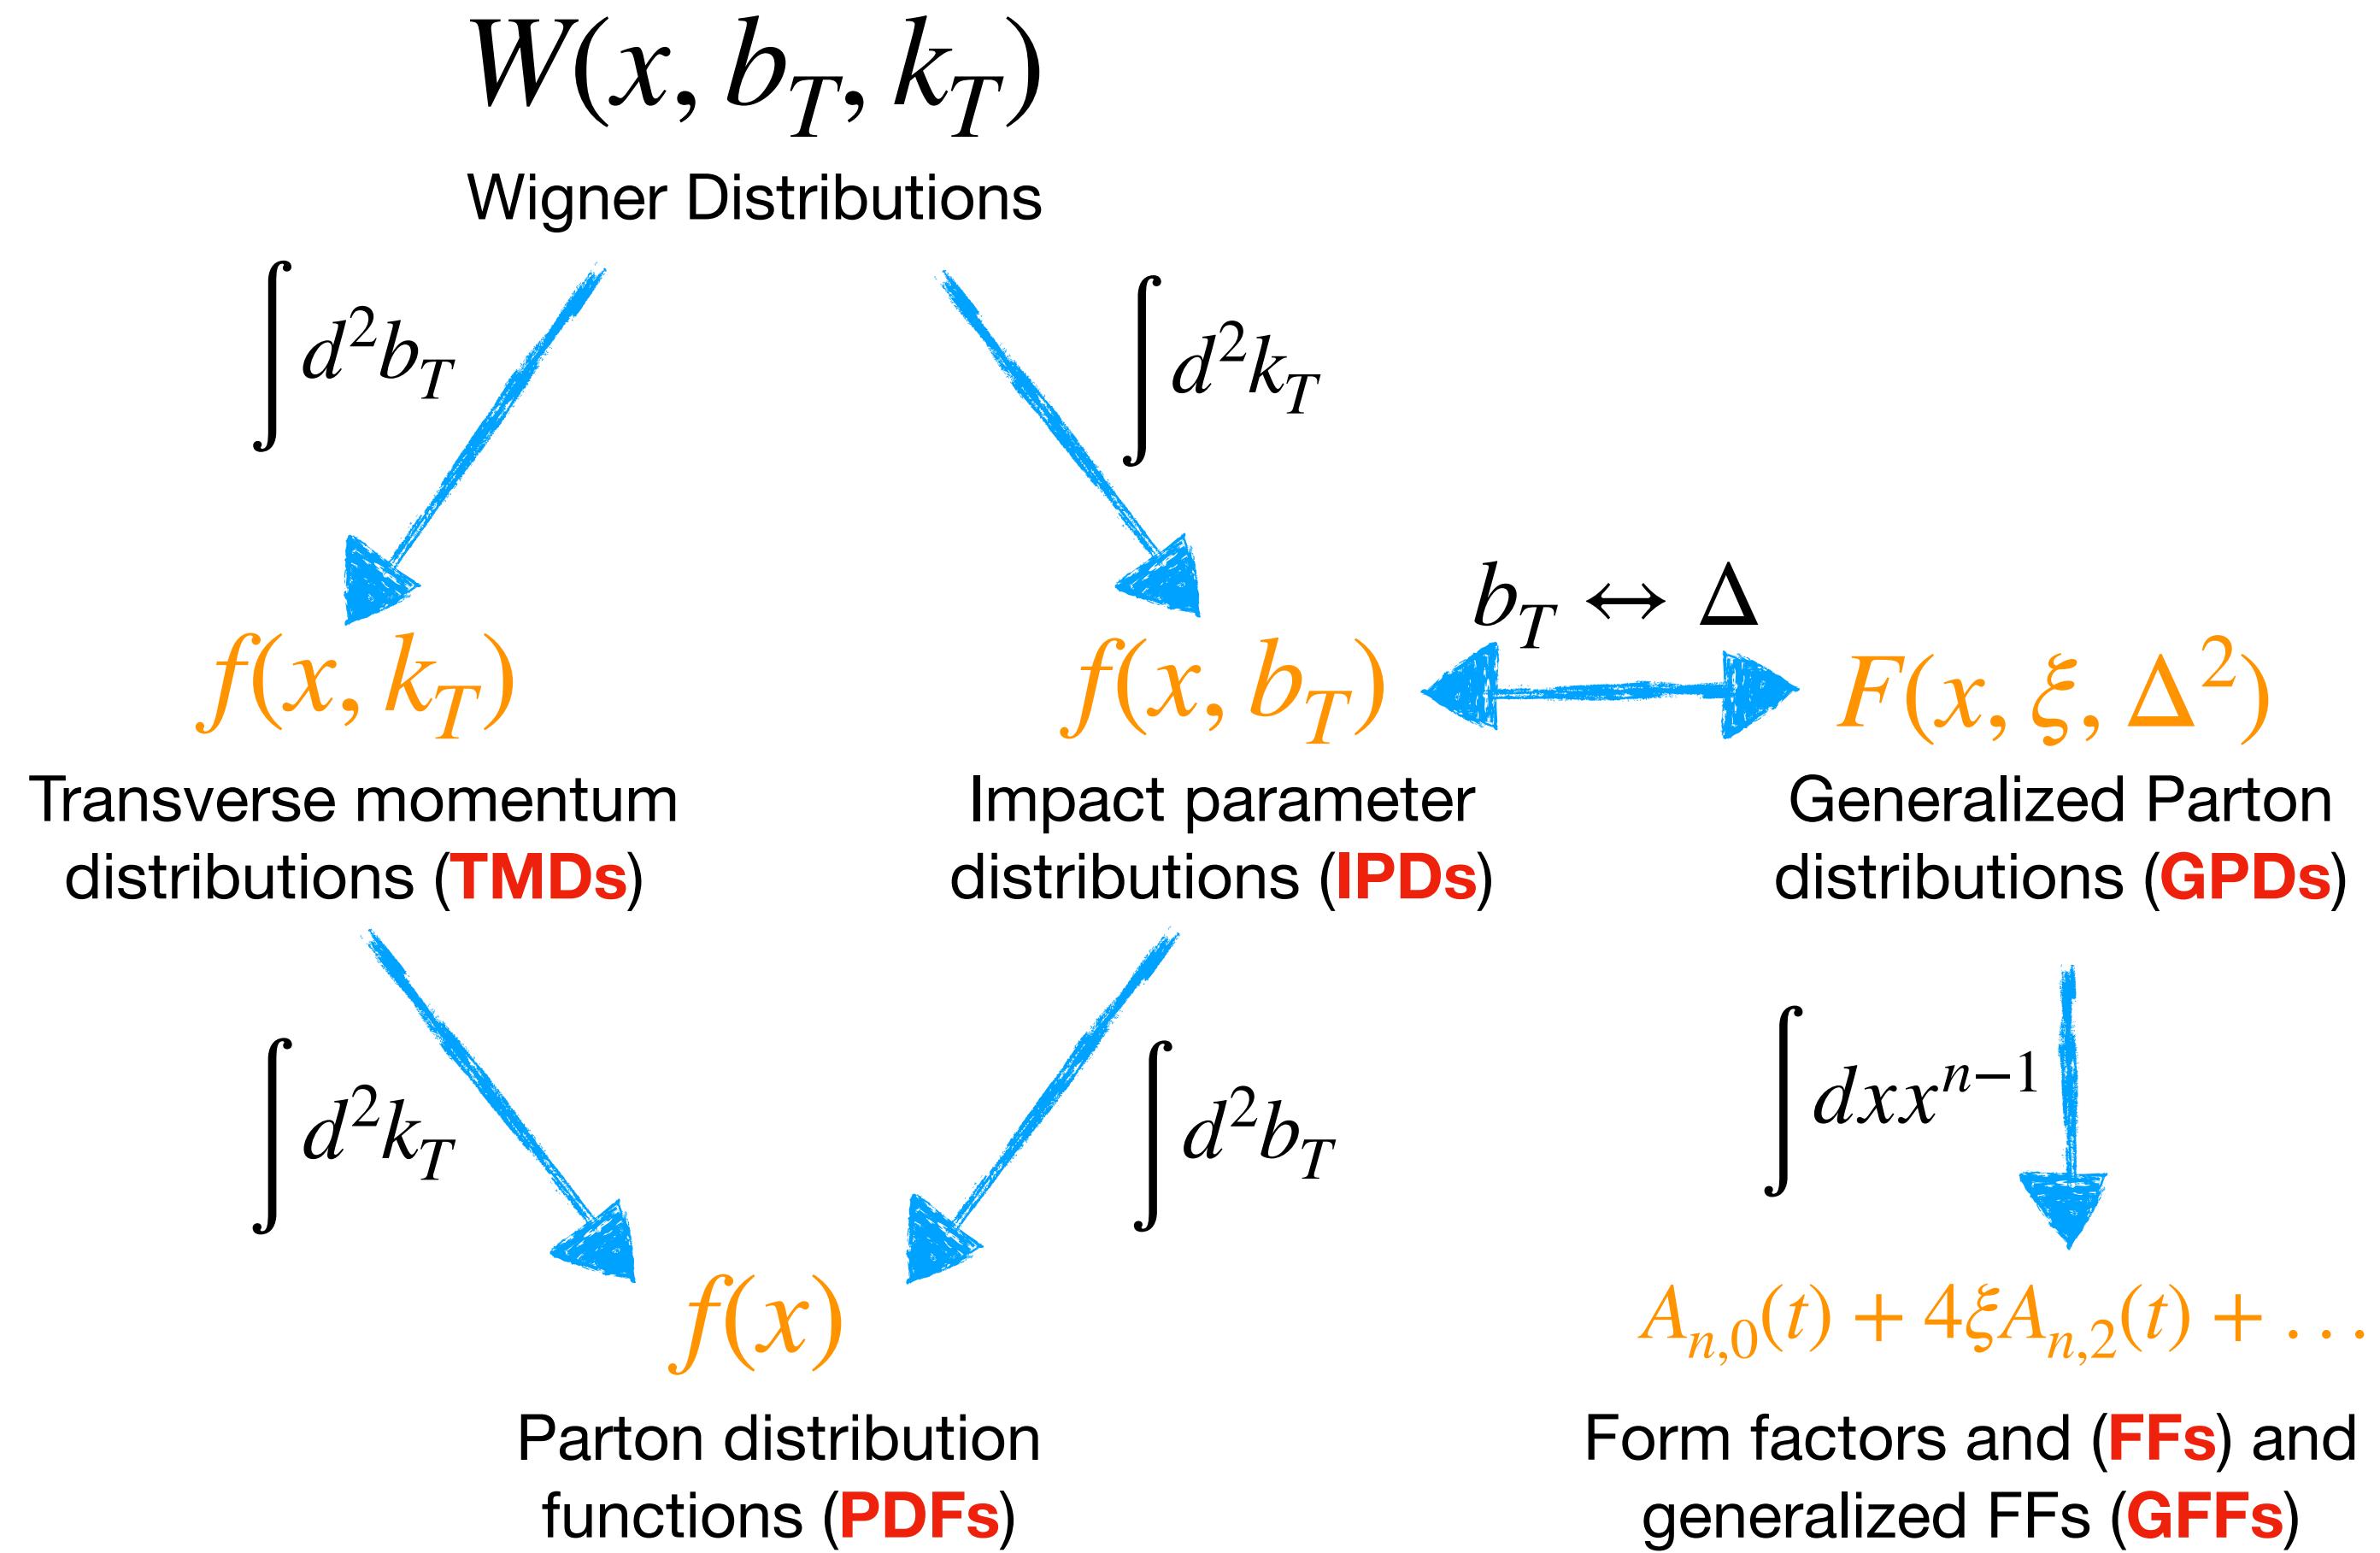

Argonne National Laboratory

Based on arXiv: 2306.14960 with Wei-Yang Liu and Yong Zhao

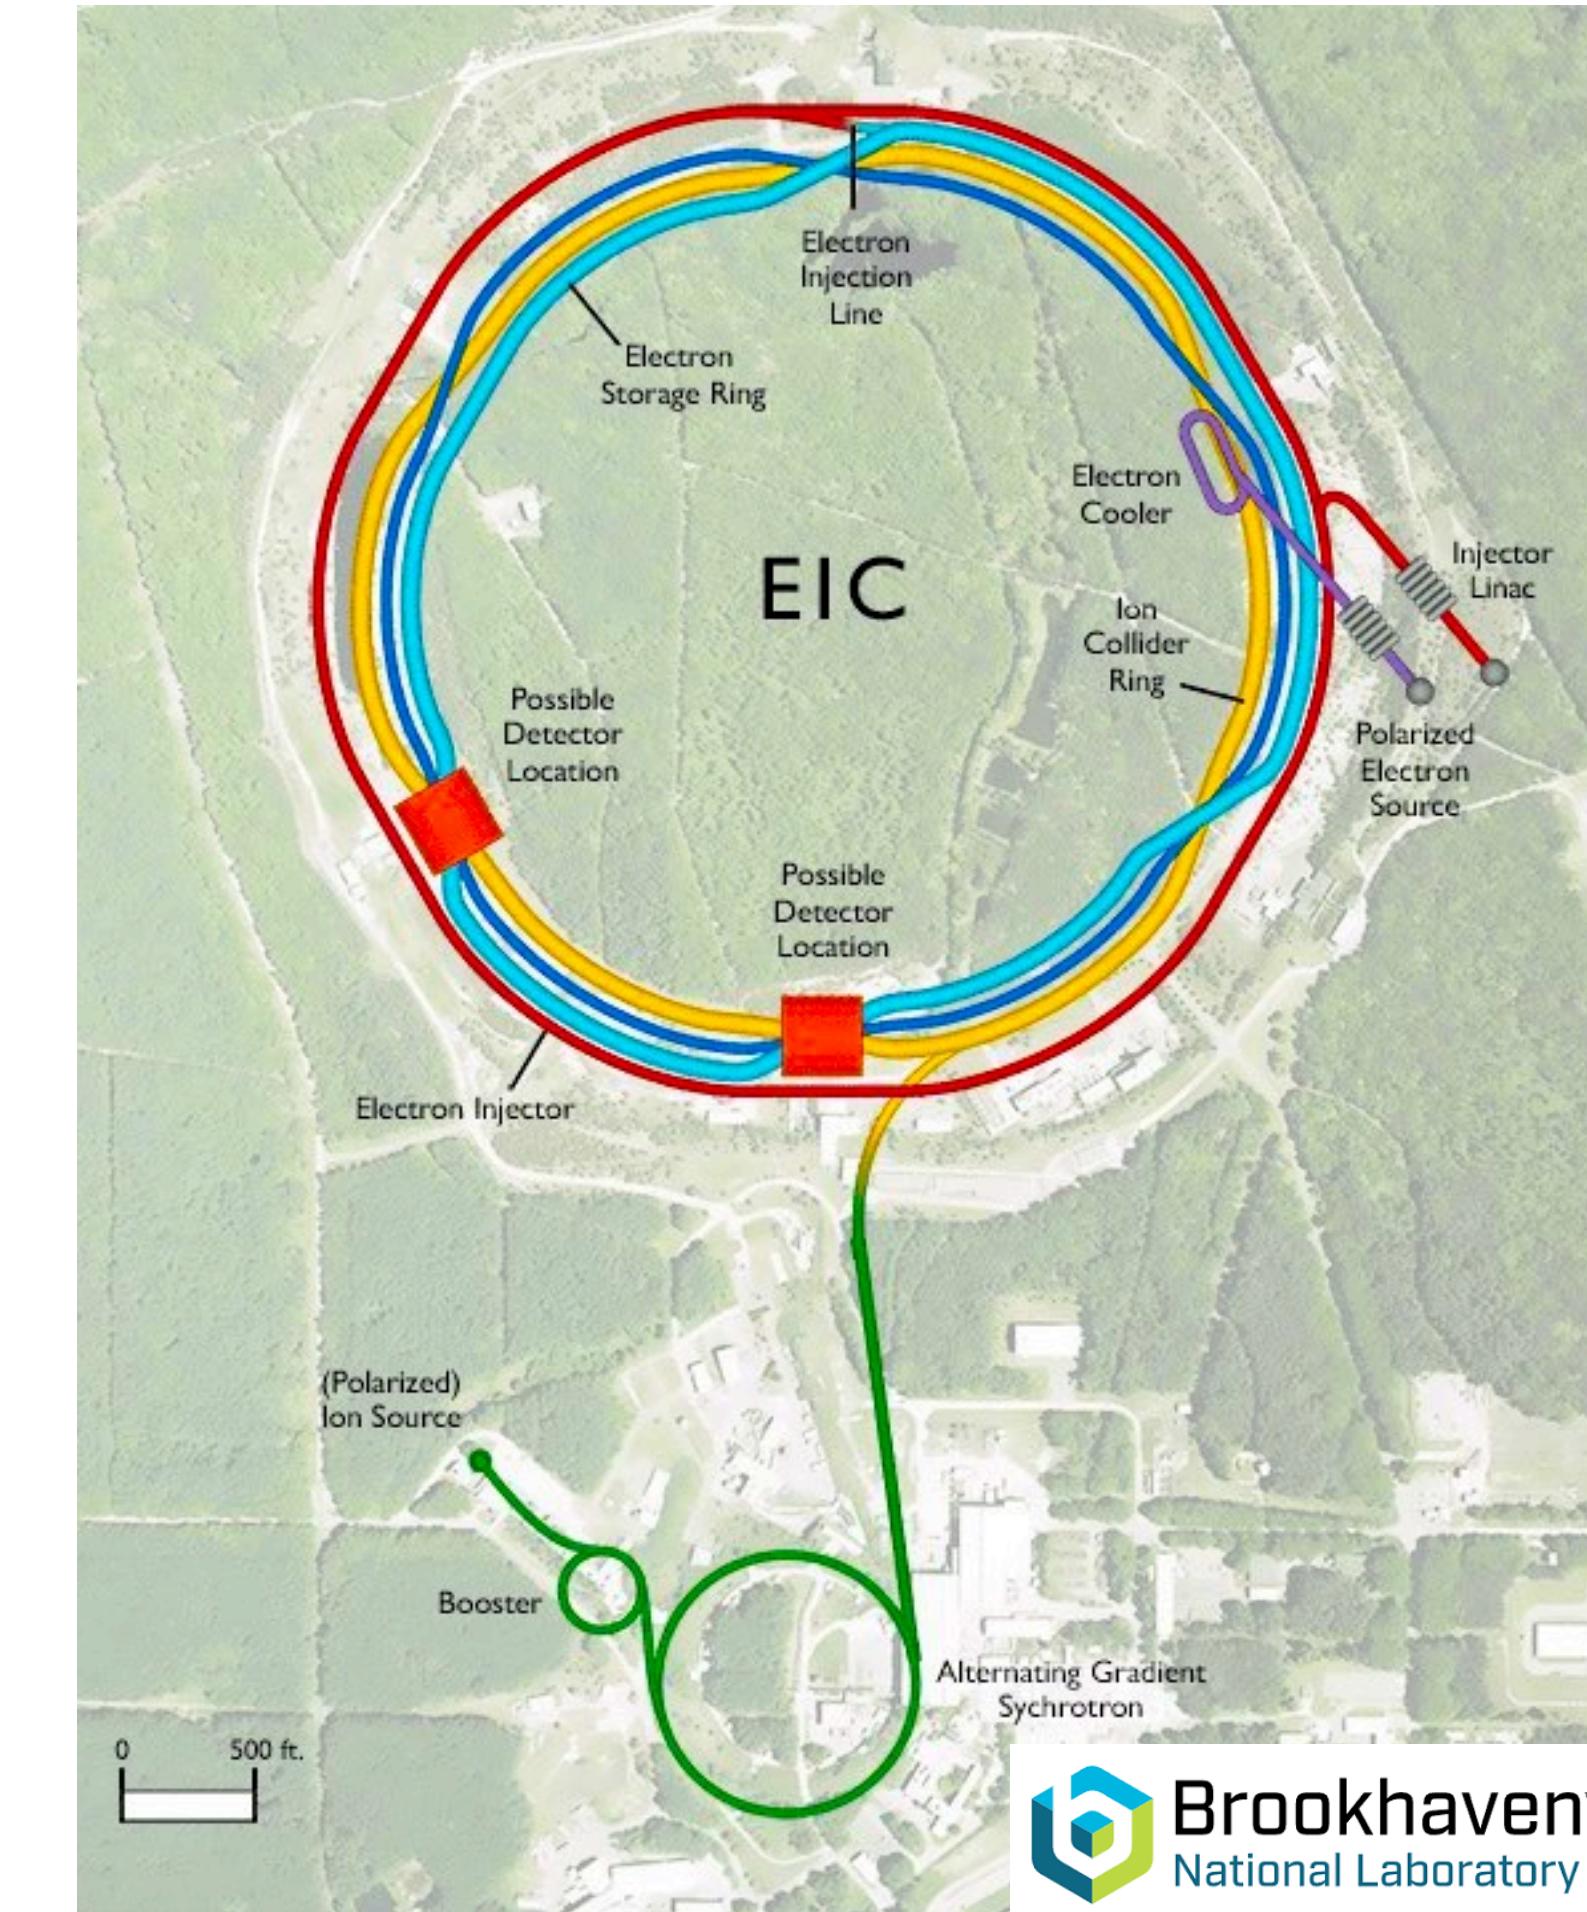

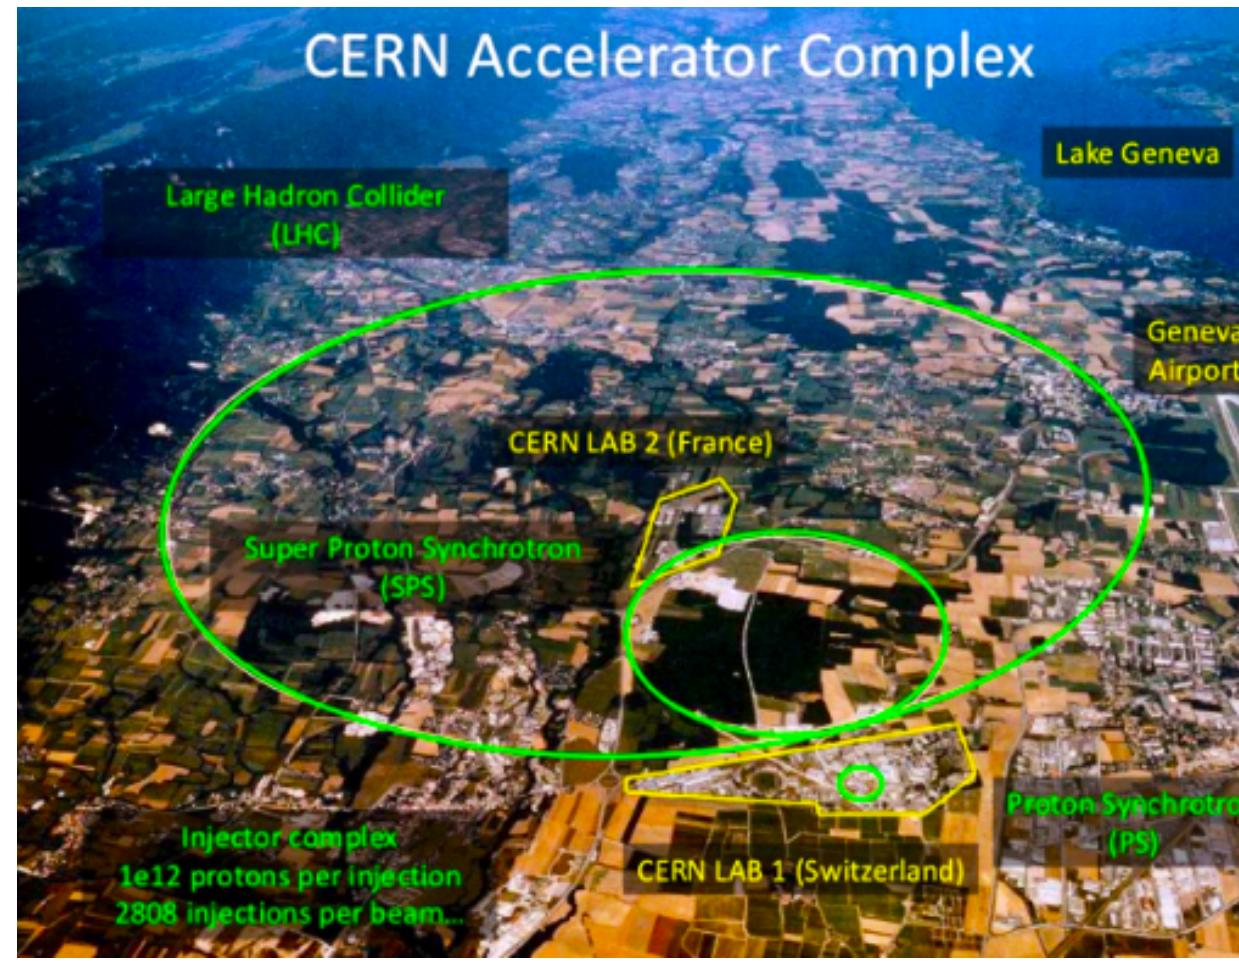

Hadron structure

- The information of hadron structure are encoded in the parton distributions.

Parton distributions from experiments

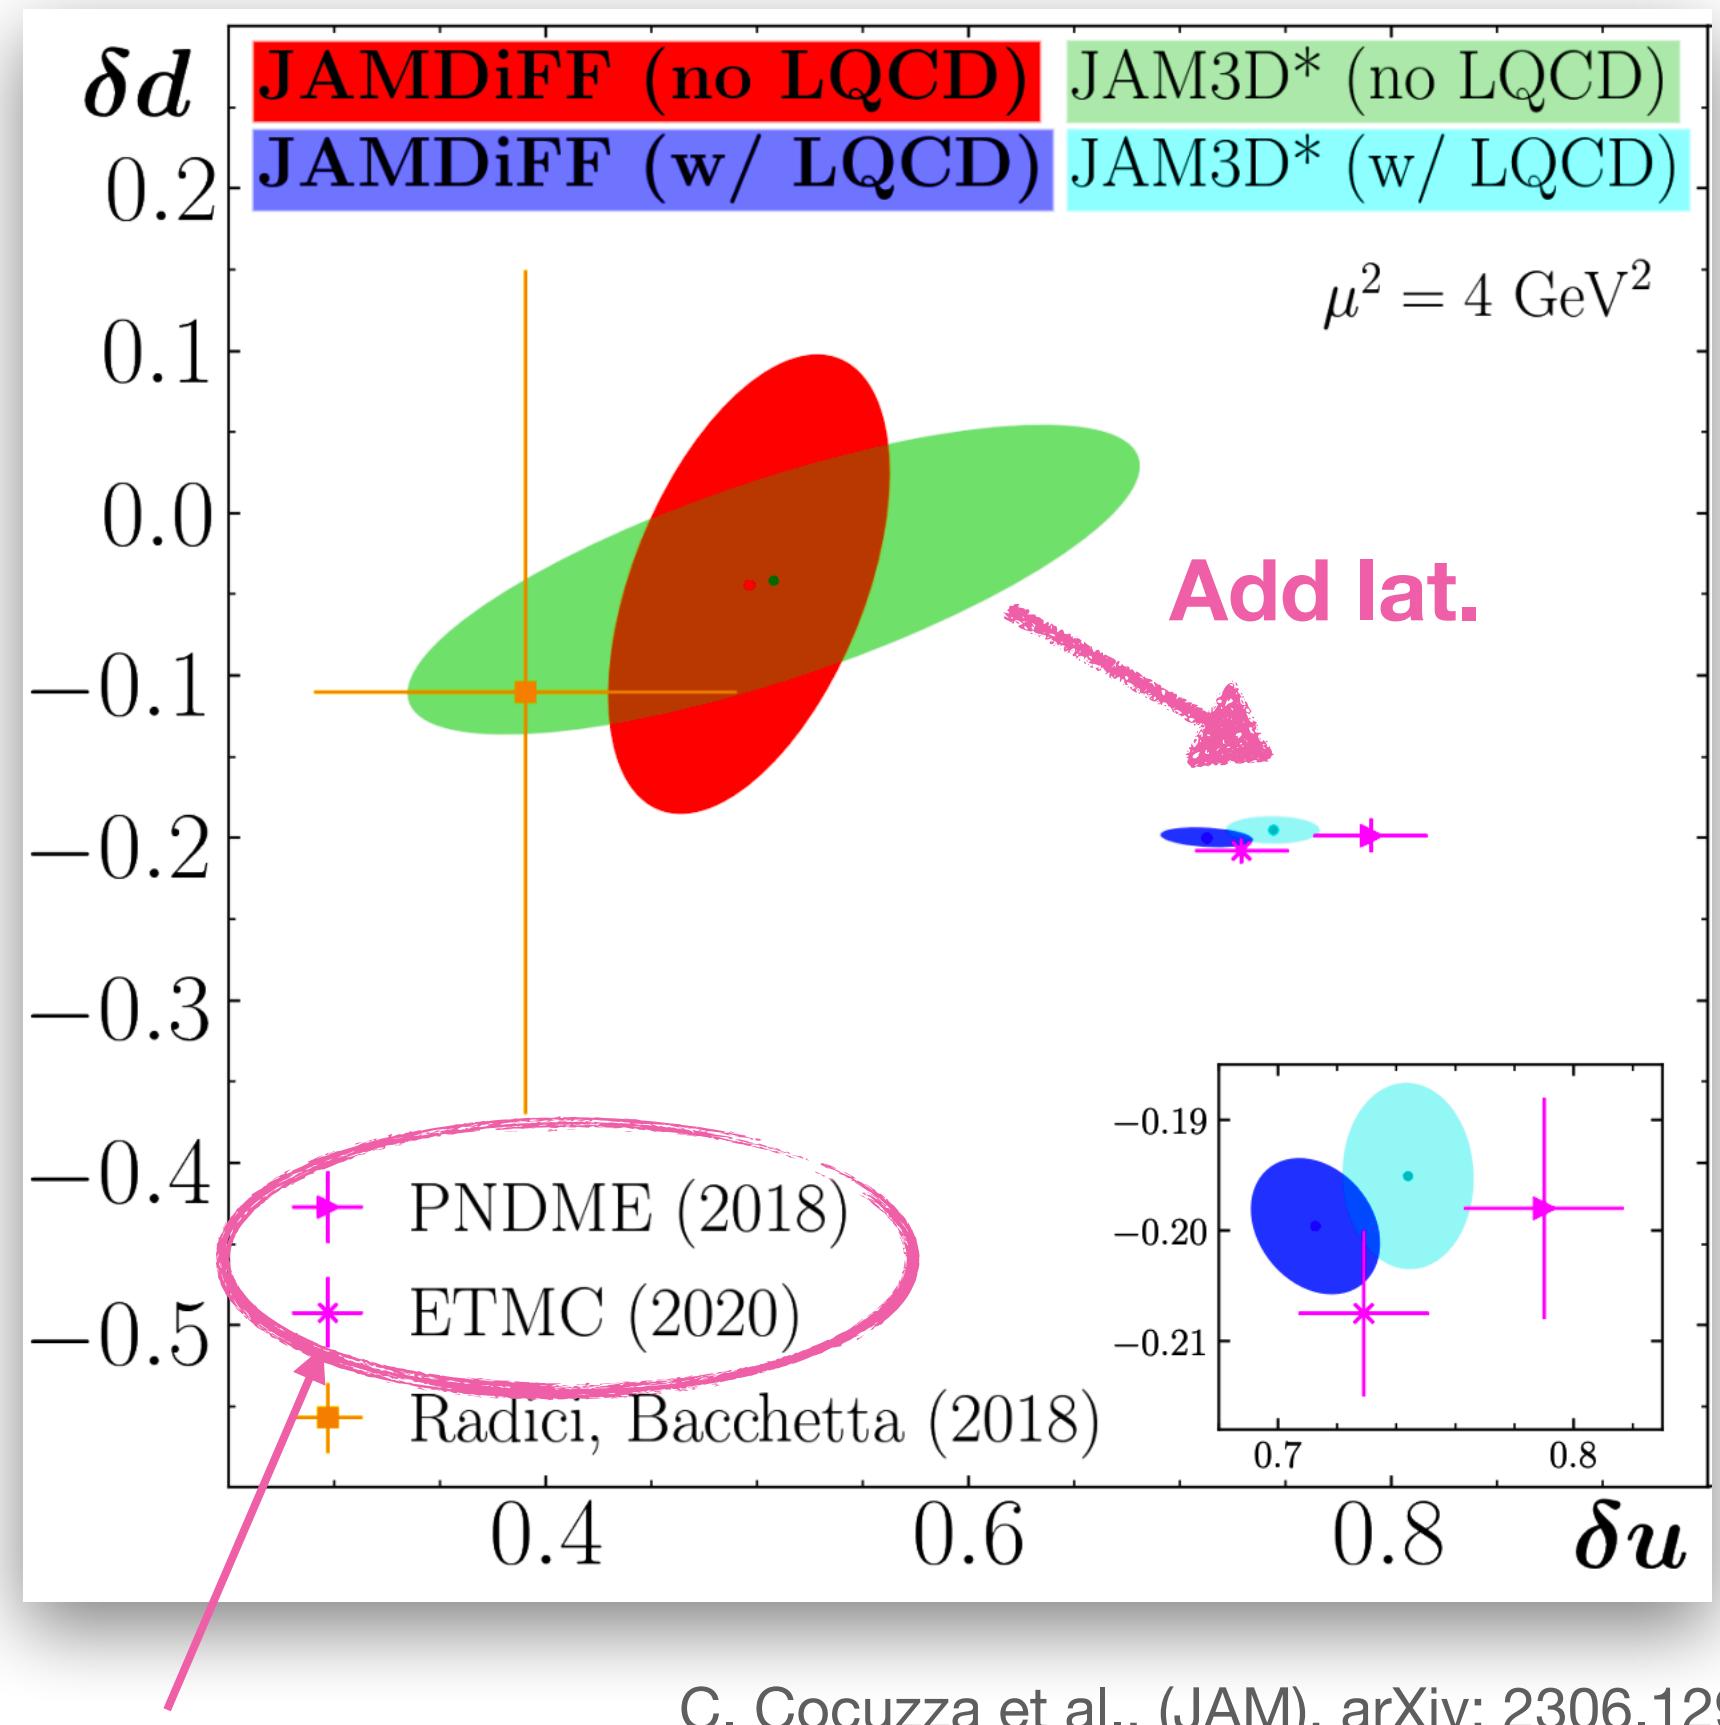

Ongoing and new experiments provide great opportunity for:

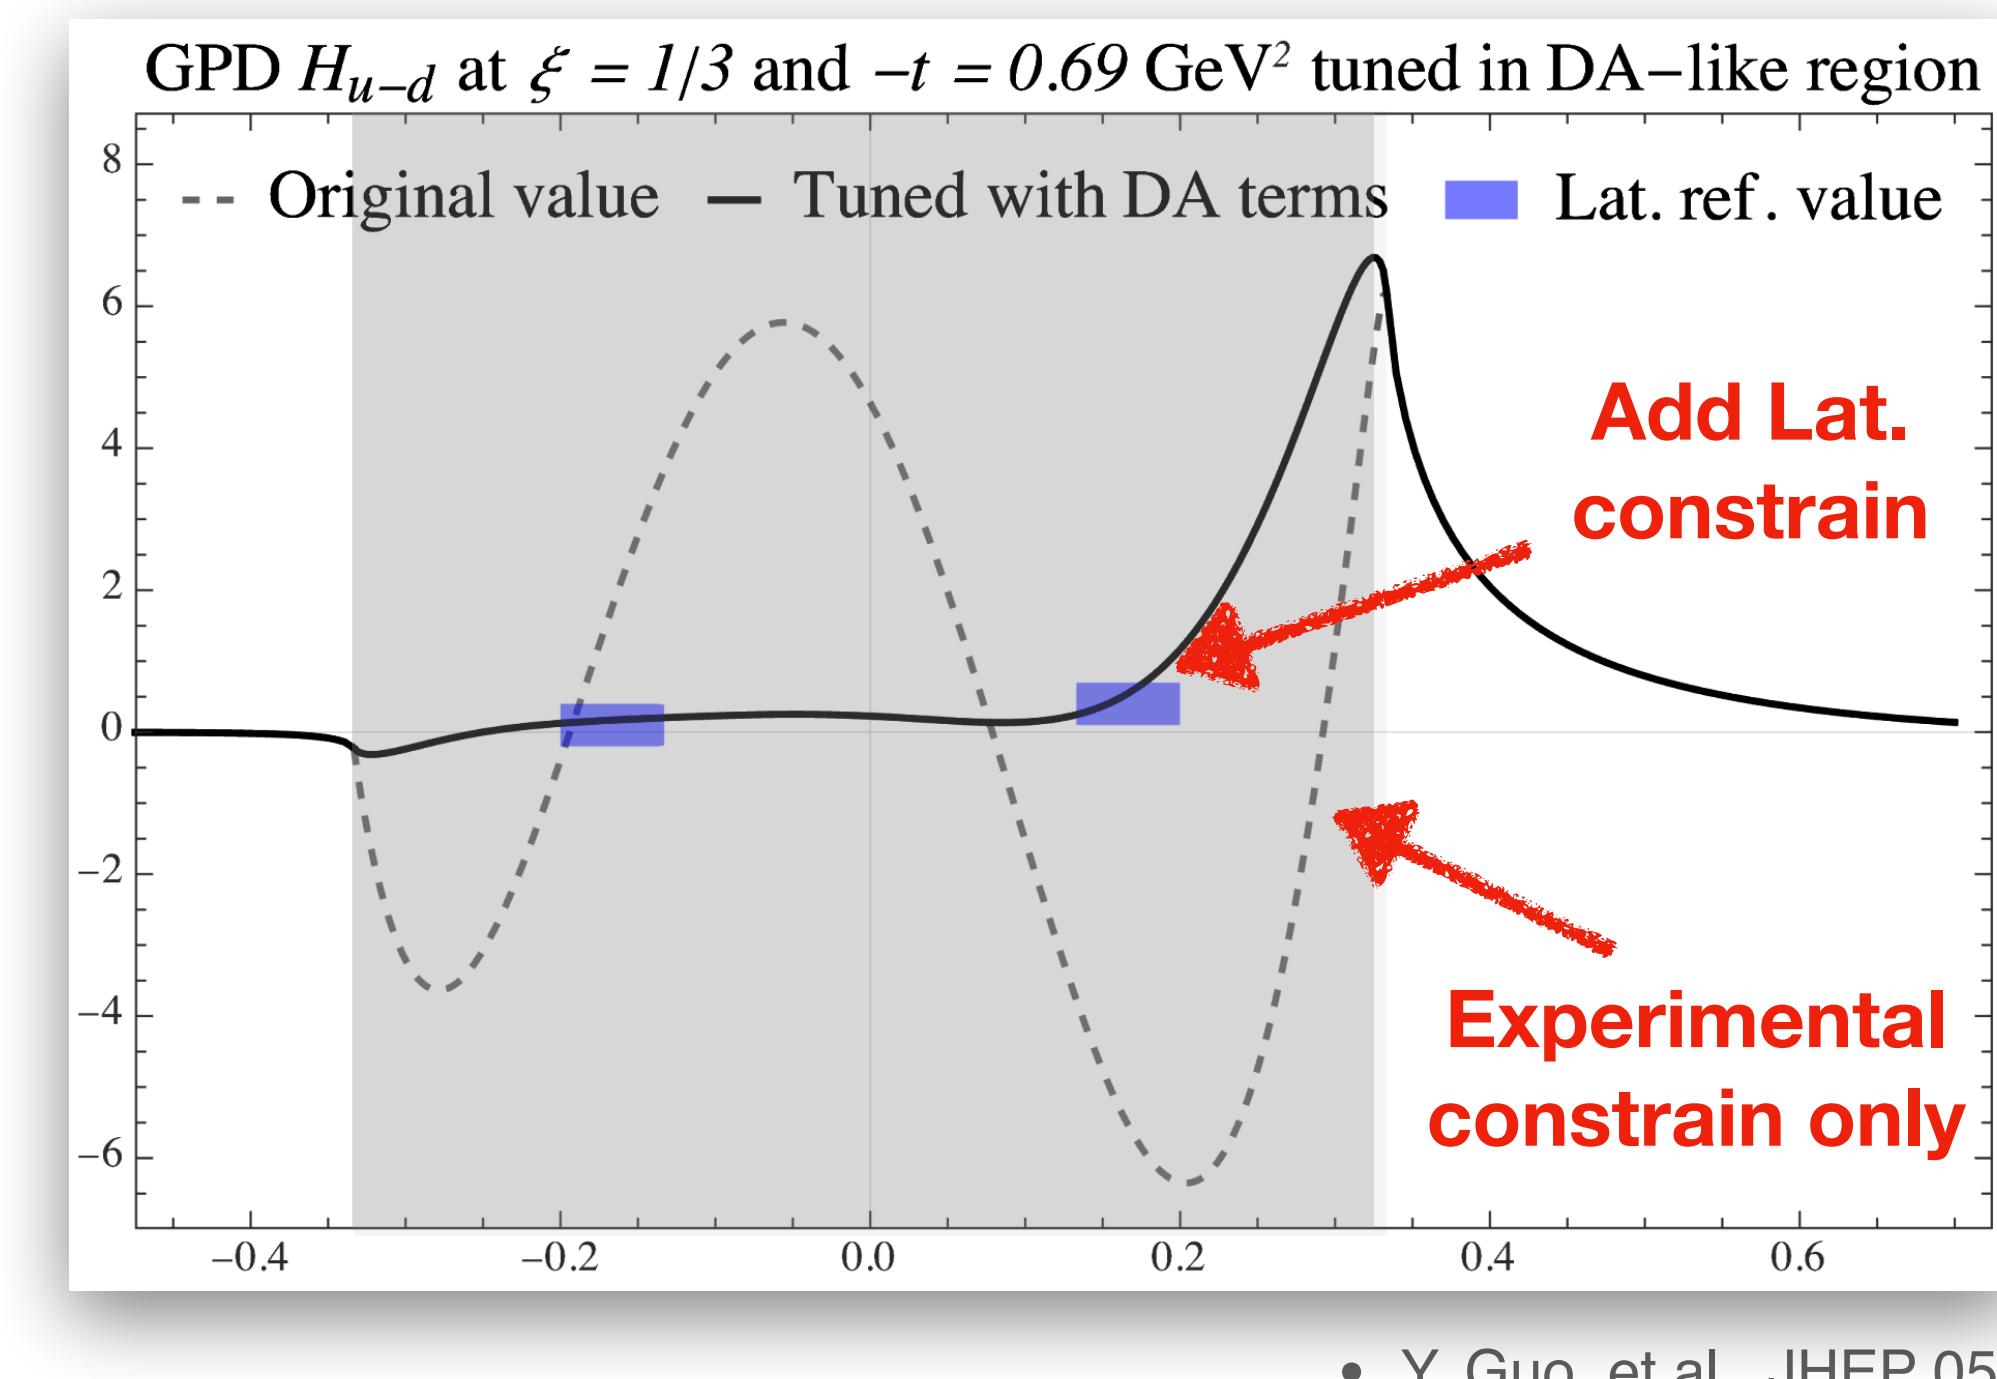

- ▶ Precision study of flavor and spin structure of nucleon.
- ▶ The three-dimensional structure of hadrons in coordinate and momentum spaces.

Parton distributions from experiments

Nucleon transversity

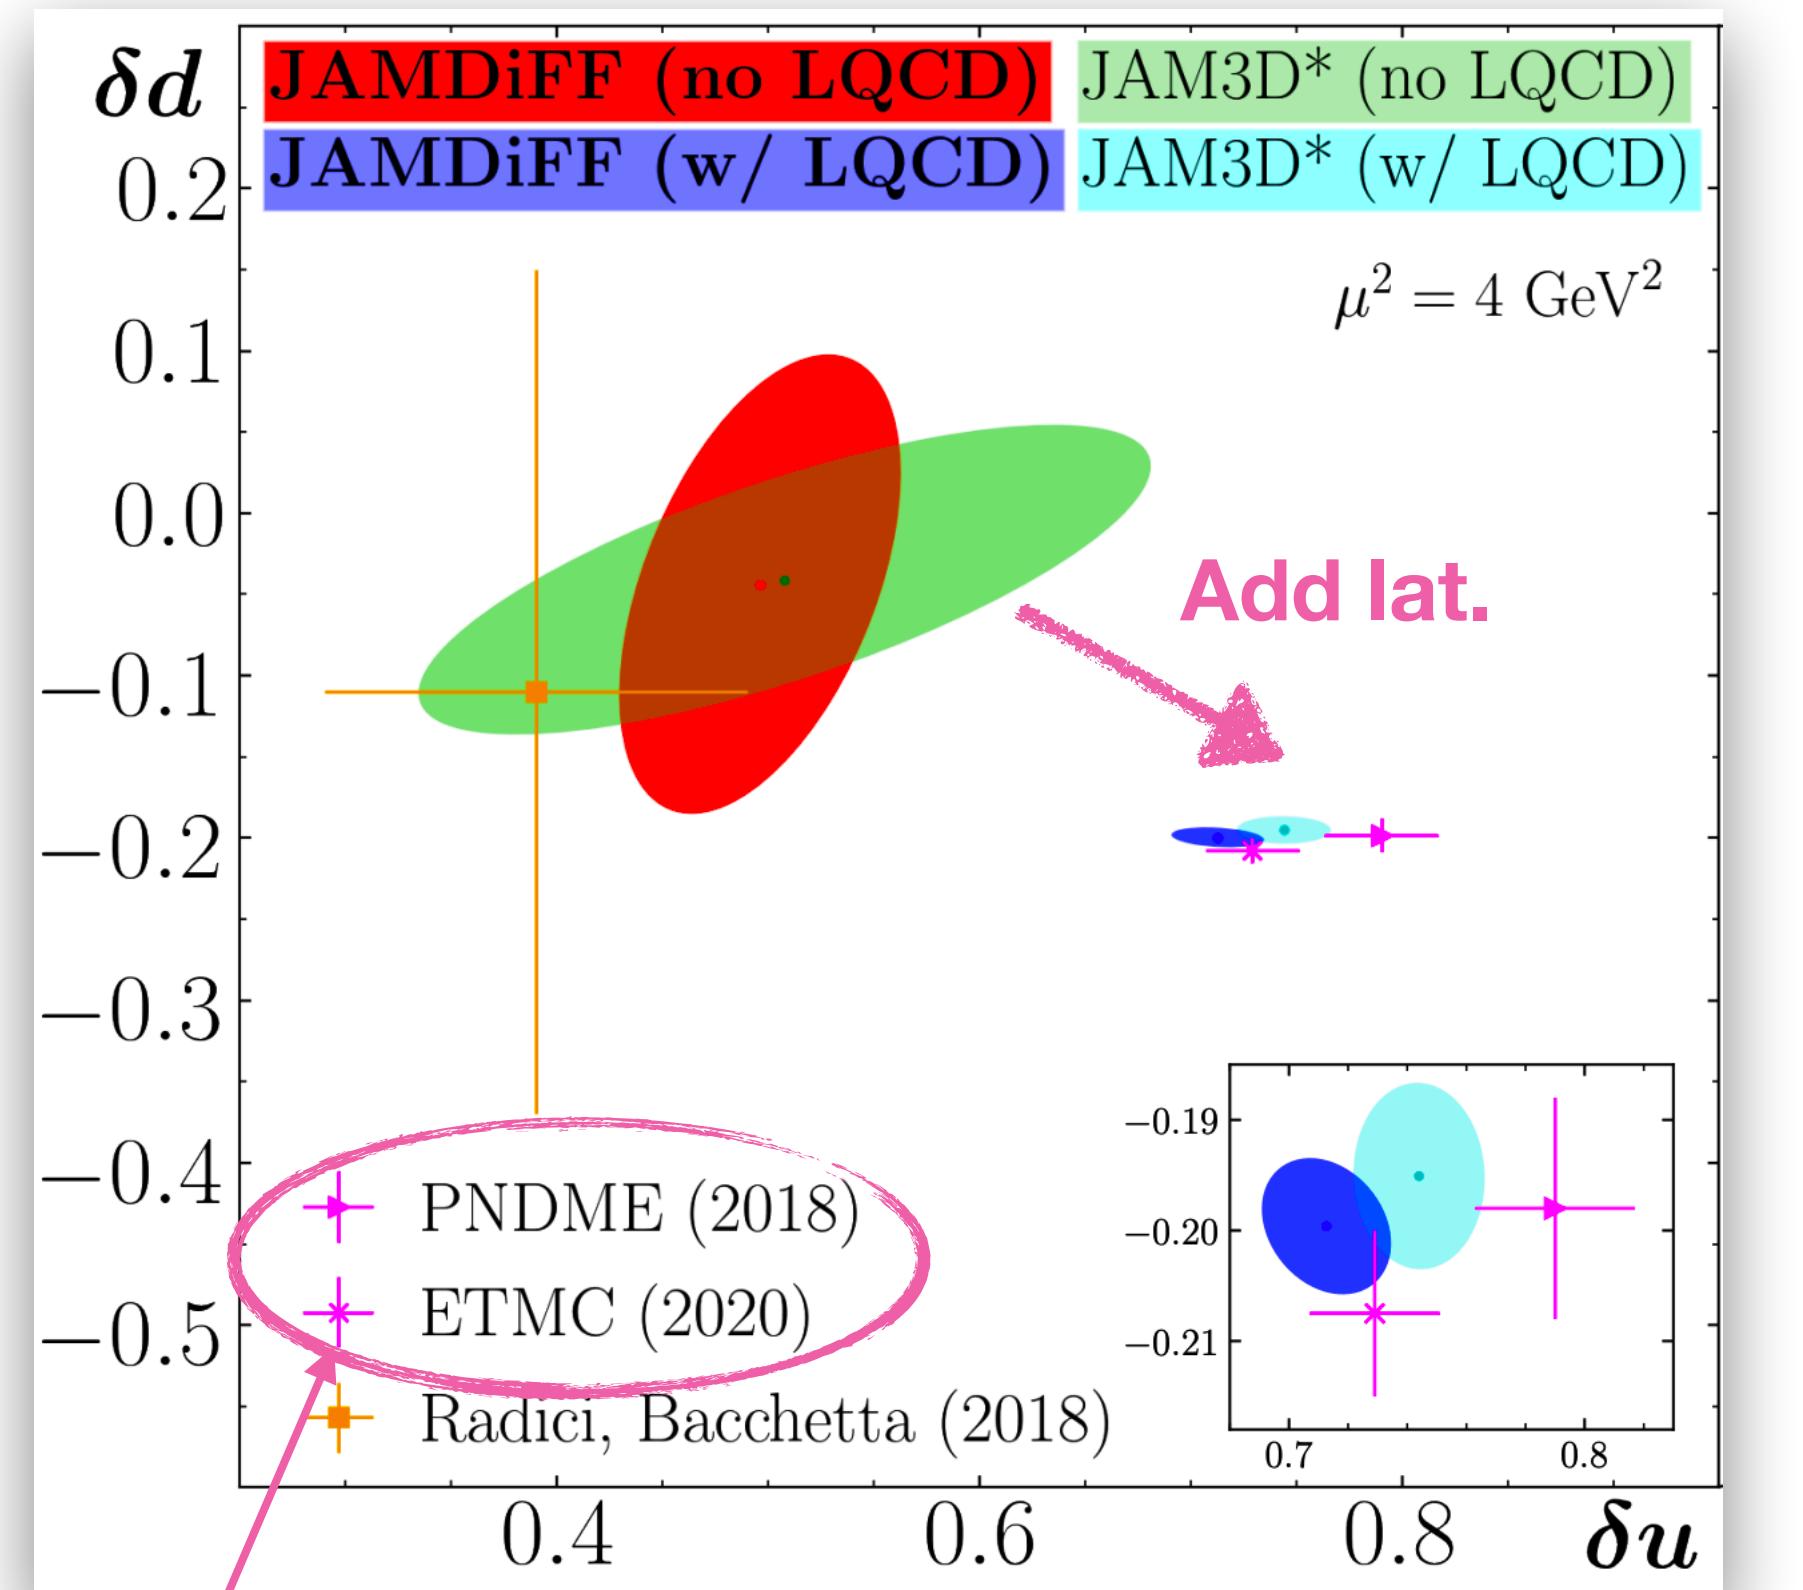

Nucleon unpolarized GPD

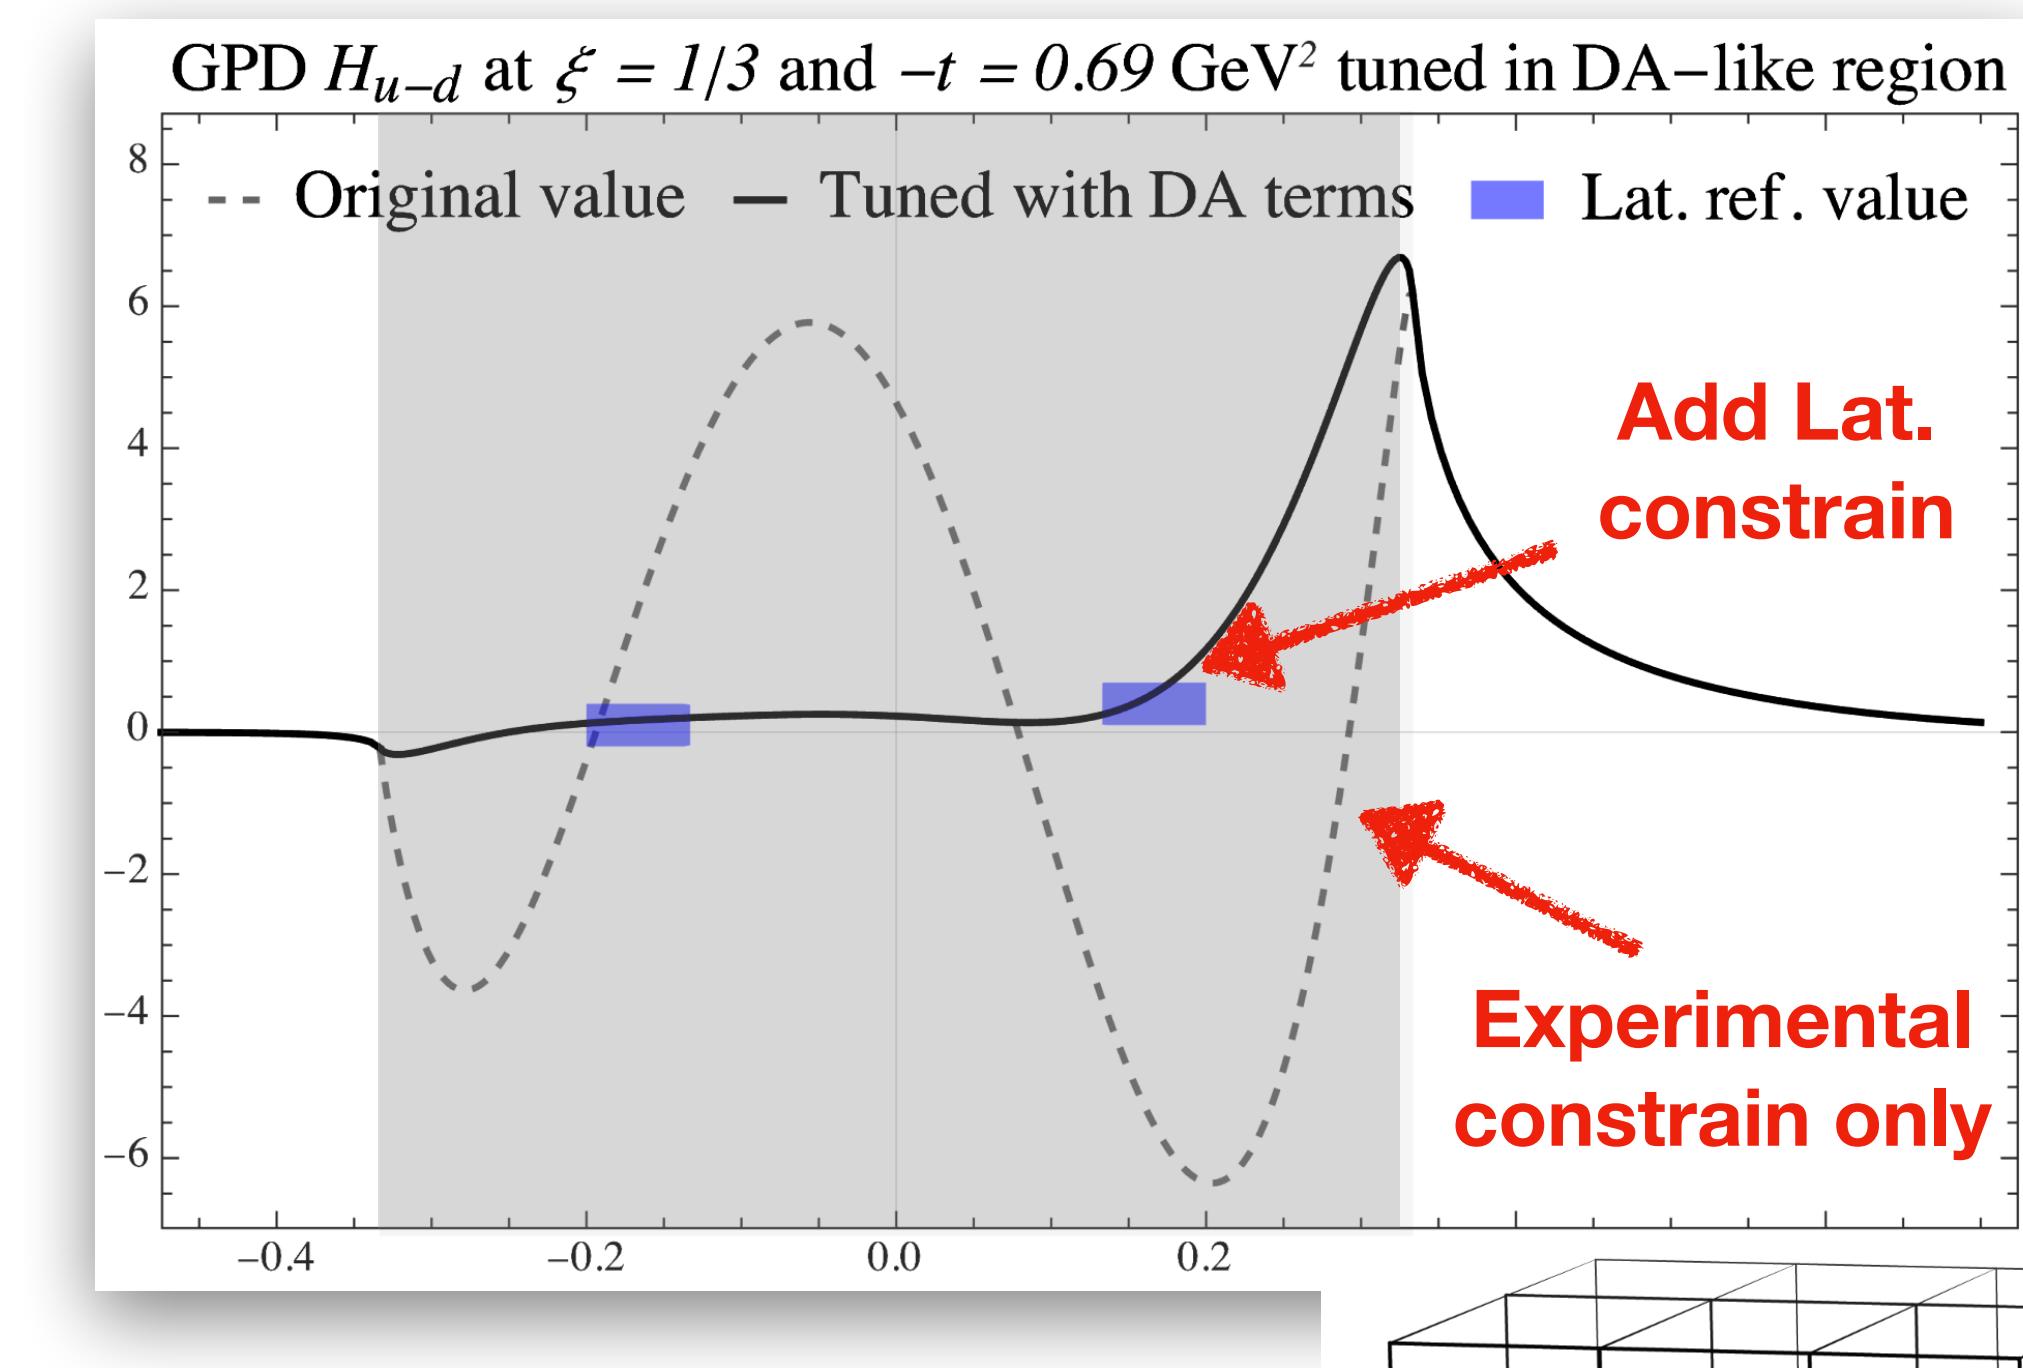

Parton distributions from experiments

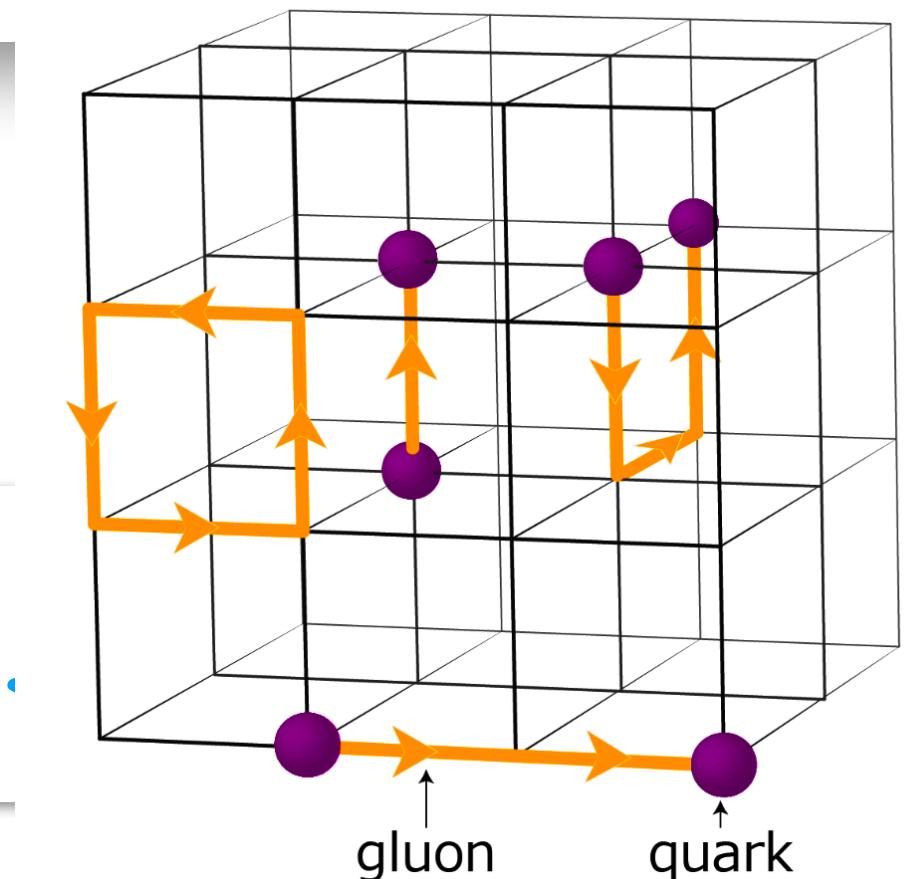

Nucleon transversity

Nucleon unpolarized GPD

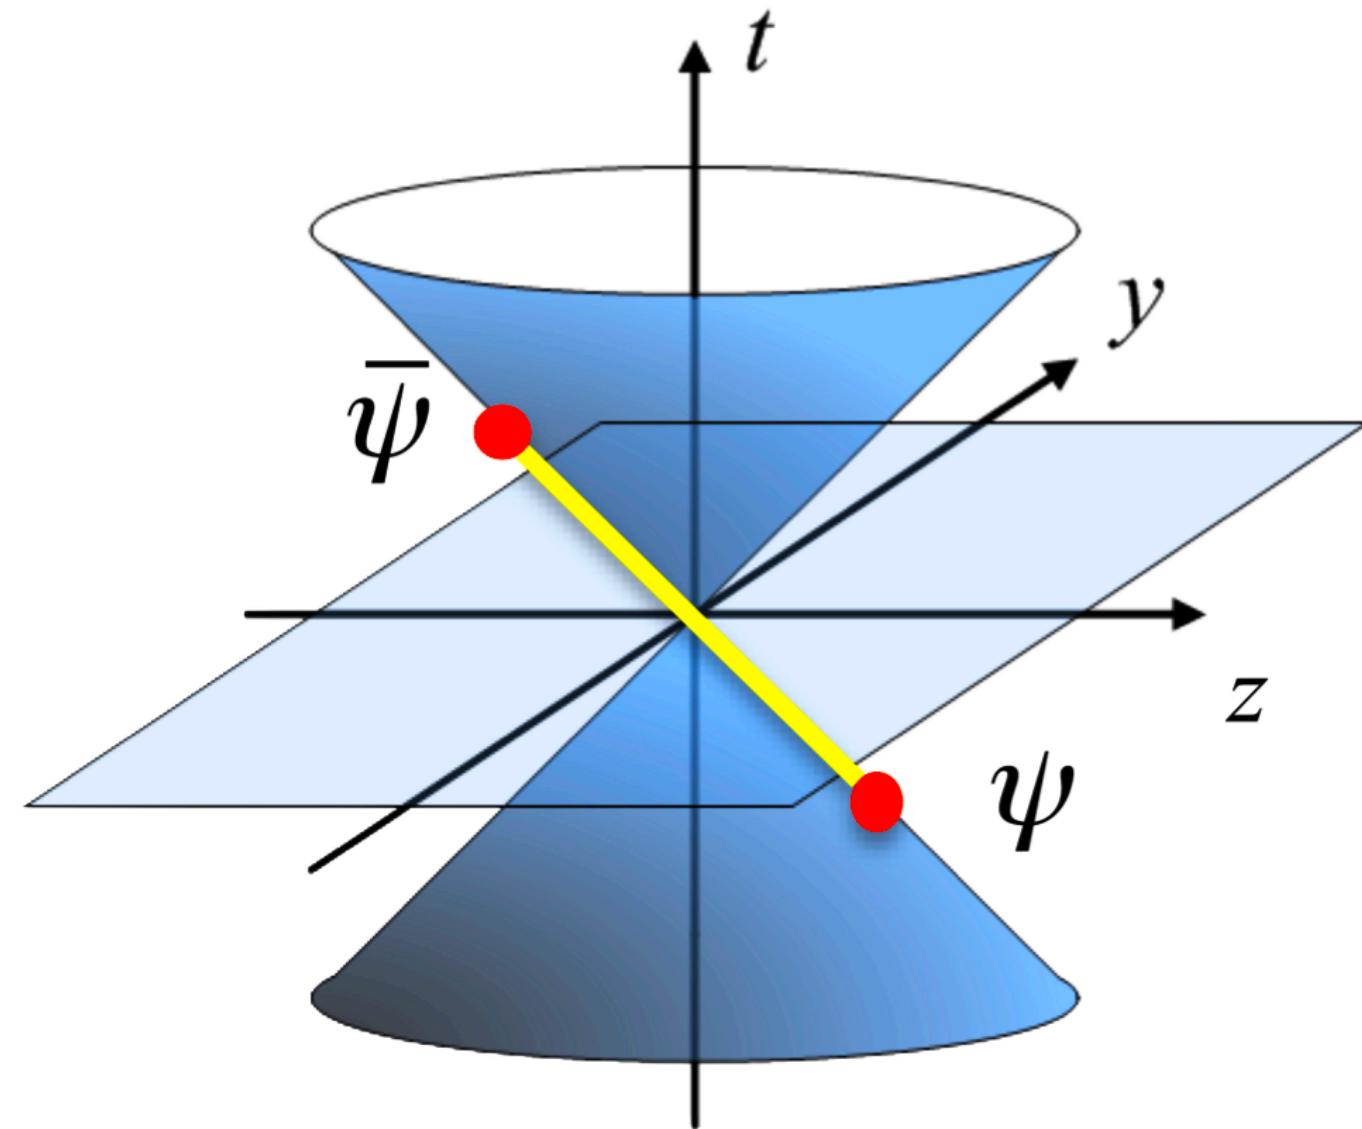

Complementary knowledge from lattice QCD is essential.

Parton distributions from lattice

- PDF from light-cone correlations

$$\langle p_f | \bar{q}(-\frac{z^-}{2}) \gamma^\mu \mathcal{W}(-\frac{z^-}{2}, \frac{z^-}{2}) q(\frac{z^-}{2}) | p_i \rangle$$

- Cannot be simulated on the Euclidean lattice

- Moments from Local operator

• Since the 1980s

$$\bar{q} \gamma^{\{\mu_1} i D^{\mu_2} \dots i D^{\mu_n\}} q$$

- Limited up to $\langle x^3 \rangle$ due to signal decay and power-divergent mixing under renormalization.

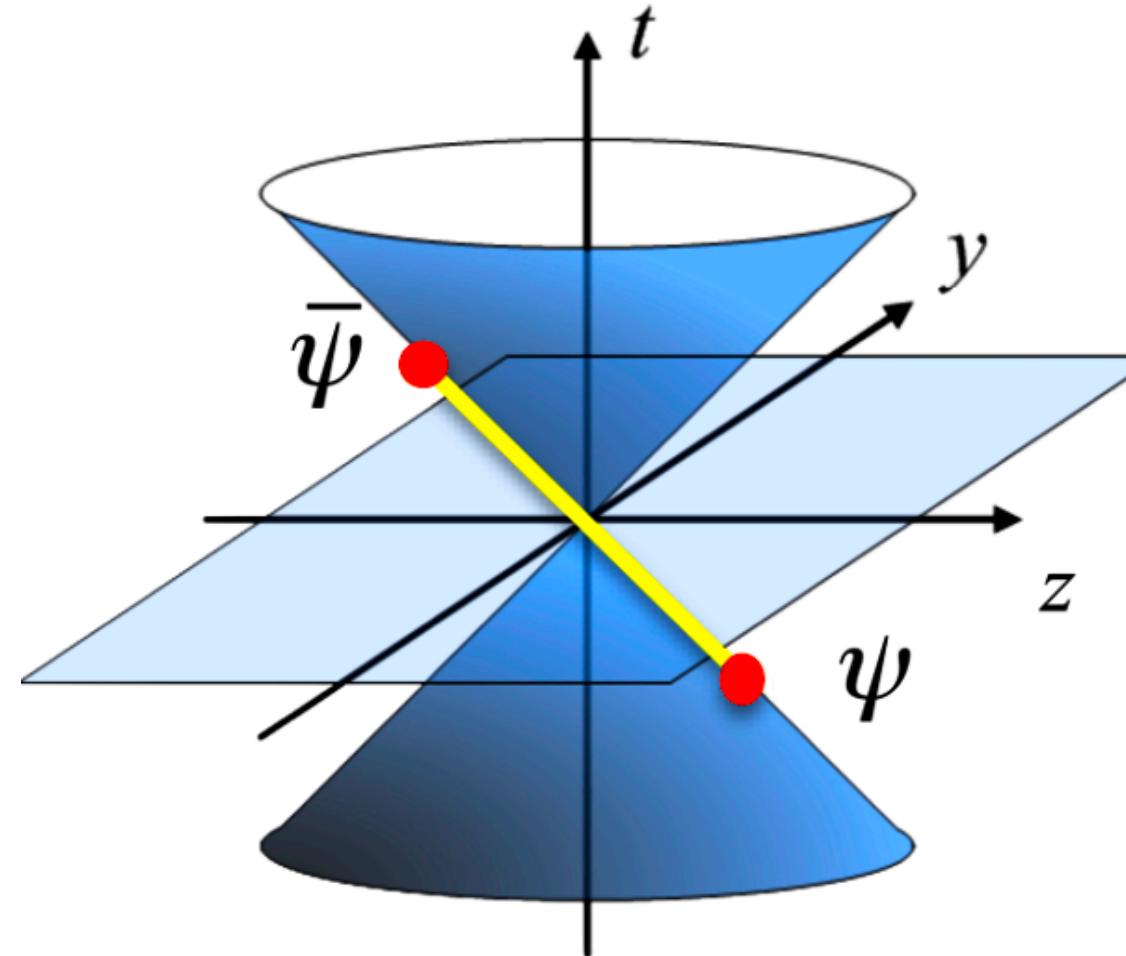

Large momentum effective theory

The quasi distribution from equal-time correlators,

- X. Ji, PRL 110 (2013); SCPMA57 (2014);

$$\tilde{q}(x, P_z, \mu) = \int \frac{dz}{4\pi} e^{-ixP_z z} \langle P | \bar{q}(0) \Gamma \mathcal{W}(0, z) q(z) | P \rangle$$

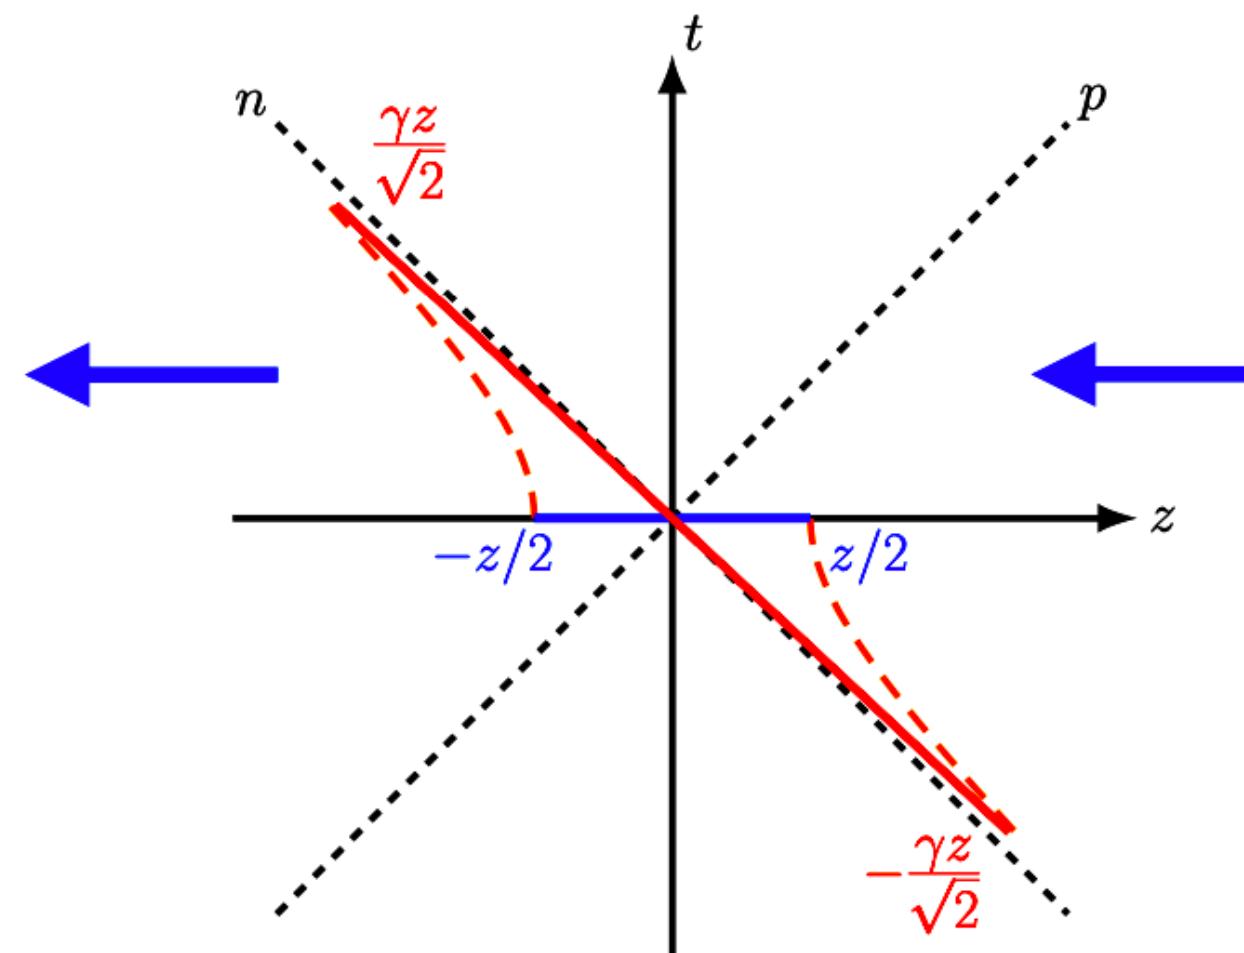

$$z + ct = 0, \quad z - ct \neq 0$$

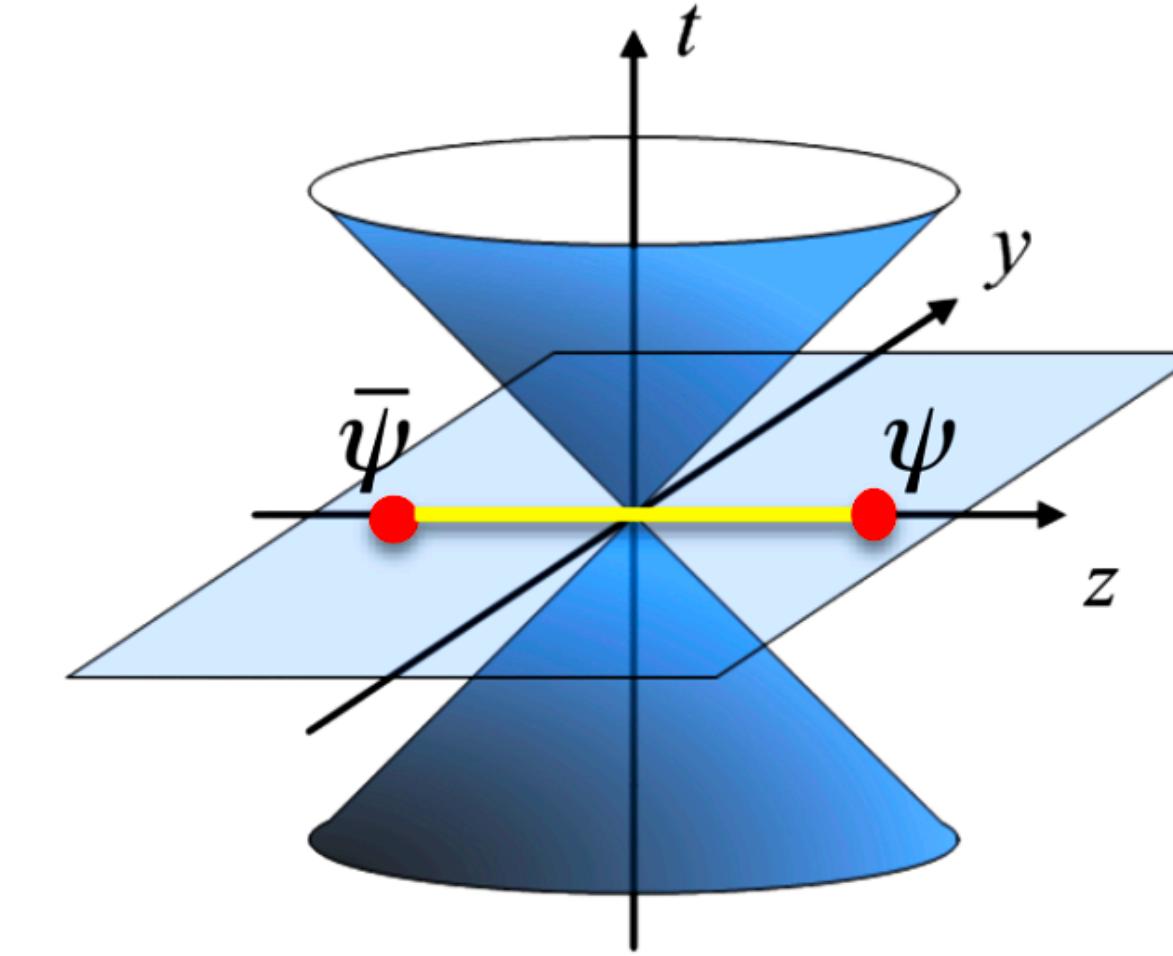

Light-cone

$$\langle P | \bar{q}(0) \Gamma \mathcal{W}(0, z^-) q(z^-) | P \rangle$$

Related by Lorentz boost

$$t = 0, \quad z \neq 0$$

Quasi

$$\langle P | \bar{q}(0) \Gamma \mathcal{W}(0, z) q(z) | P \rangle$$

Large momentum effective theory

- X. Ji, PRL 110 (2013); SCPMA57 (2014);
- X. Xiong, X. Ji, et al, 90 PRD (2014);
- Y.-Q. Ma, et al, PRD98 (2018), PRL 120 (2018);
- T. Izubuchi, X. Ji, et al PRD98 (2018).
- X. Ji, Y. Zhao, et al, RMP 93 (2021).

Large P_z expansion of quasi distribution:

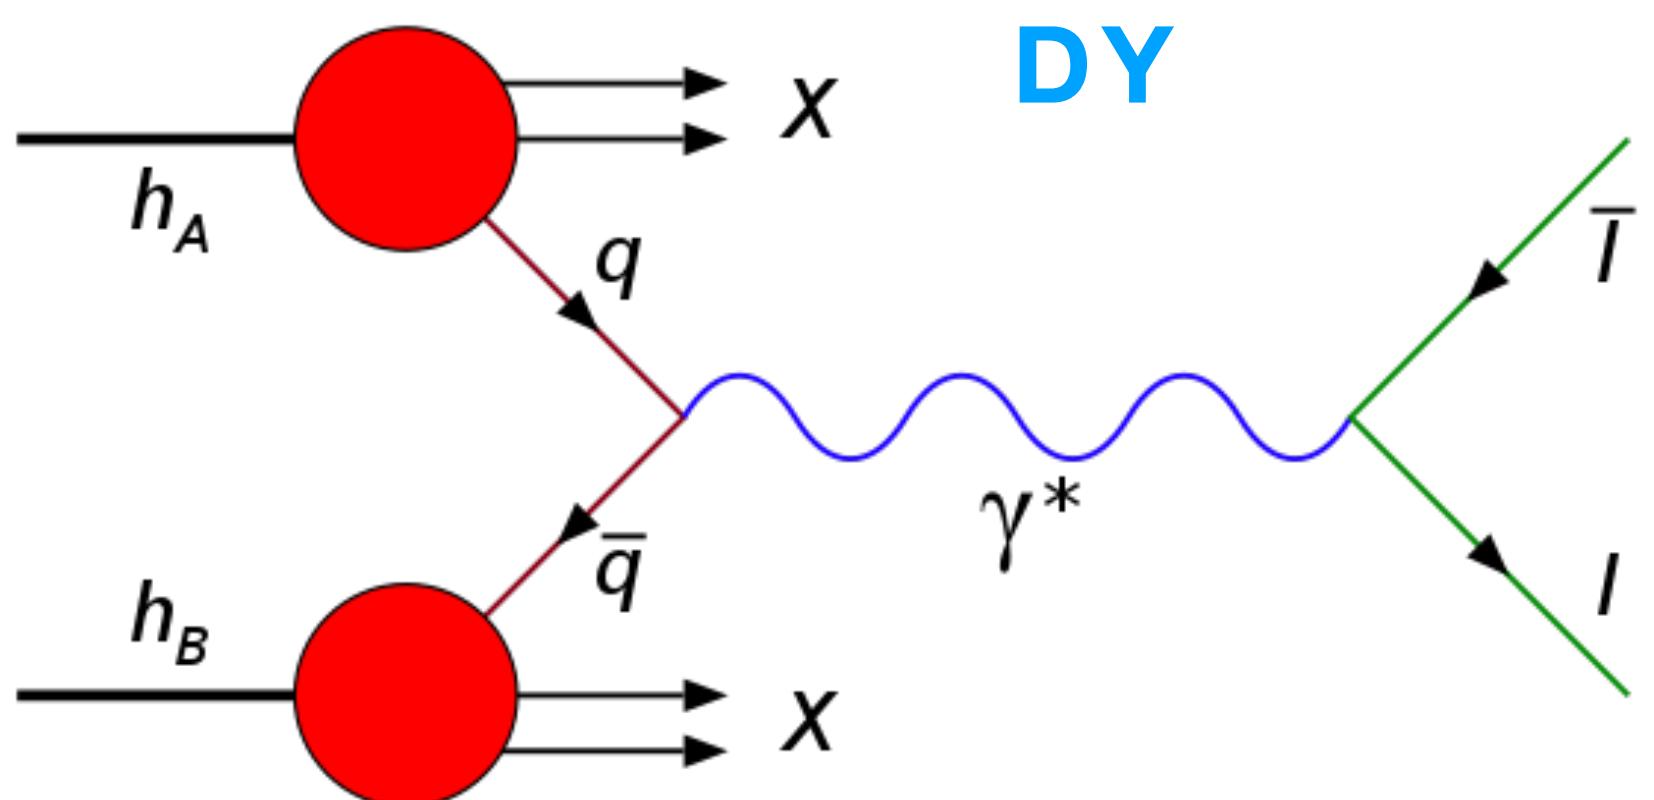

$$\tilde{q}(x, P_z, \mu) = \int \frac{dy}{|y|} C(\xi, \frac{\mu}{yP_z}) q(y, \mu) + \mathcal{O}(\frac{\Lambda_{QCD}^2}{x^2 P_z^2}, \frac{\Lambda_{QCD}^2}{(1-x)^2 P_z^2})$$

Perturbative kernel

large P_z is the key

$$\xi = x/y$$

► Similar to DIS, DY, ..., LaMET has direct sensitivity to the local $x \in [x_{\min}, x_{\max}]$ dependence of light-cone PDF $q(x, \mu)$.

$$\frac{d\sigma}{dQ^2} = \sigma_0 \sum_{a,b} \int \frac{dx_1}{x_1} \int \frac{dx_2}{x_2} q_a^A(x_1, \mu^2) q_b^B(x_2, \mu^2) \omega_{ab}(z, \frac{\mu}{Q})$$

Short distance factorization

- SDF/OPE in coordinate space: Ioffe-time pseudo distributions

$$\begin{aligned}
 \tilde{h}(z, P_z, \mu) &= \tilde{h}(z^2, \lambda, \mu) \\
 &= \sum_{n=0}^{\infty} \frac{(-izP)^n}{n!} C_n(z^2\mu^2) \langle x^n \rangle(\mu) + \mathcal{O}(z^2\Lambda_{\text{QCD}}^2) \\
 &= \int_{-1}^1 d\alpha \mathcal{C}(\alpha, \mu^2 z^2) \int_{-1}^1 dy e^{-iy\lambda} q(y, \mu) + \mathcal{O}(z^2\Lambda_{\text{QCD}}^2)
 \end{aligned}$$

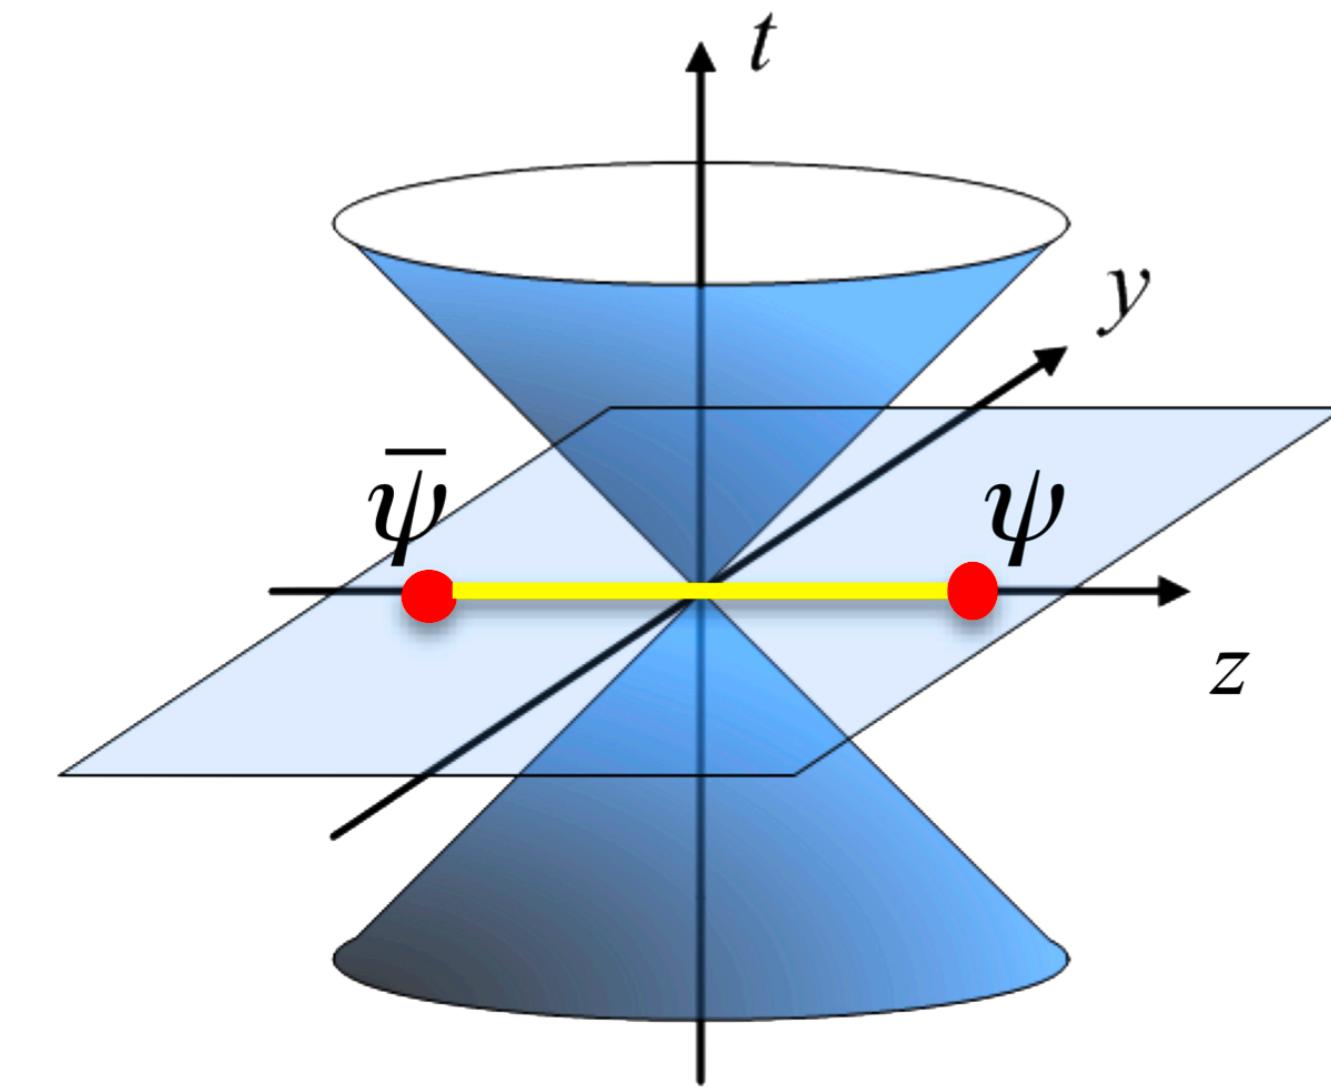

$\lambda = zP_z$

Sum over the moments

- ▶ Extract moments $\langle x^n \rangle$ without power divergent mixing.
- ▶ The information is limited by the range of finite $\lambda = zP_z$, large P_z essential.

- A. V. Radyushkin et al., PRD 96 (2017).
- K. Orginos et al., PRD 96 (2017).
- T. Izubuchi et al., PRD 98 (2018).

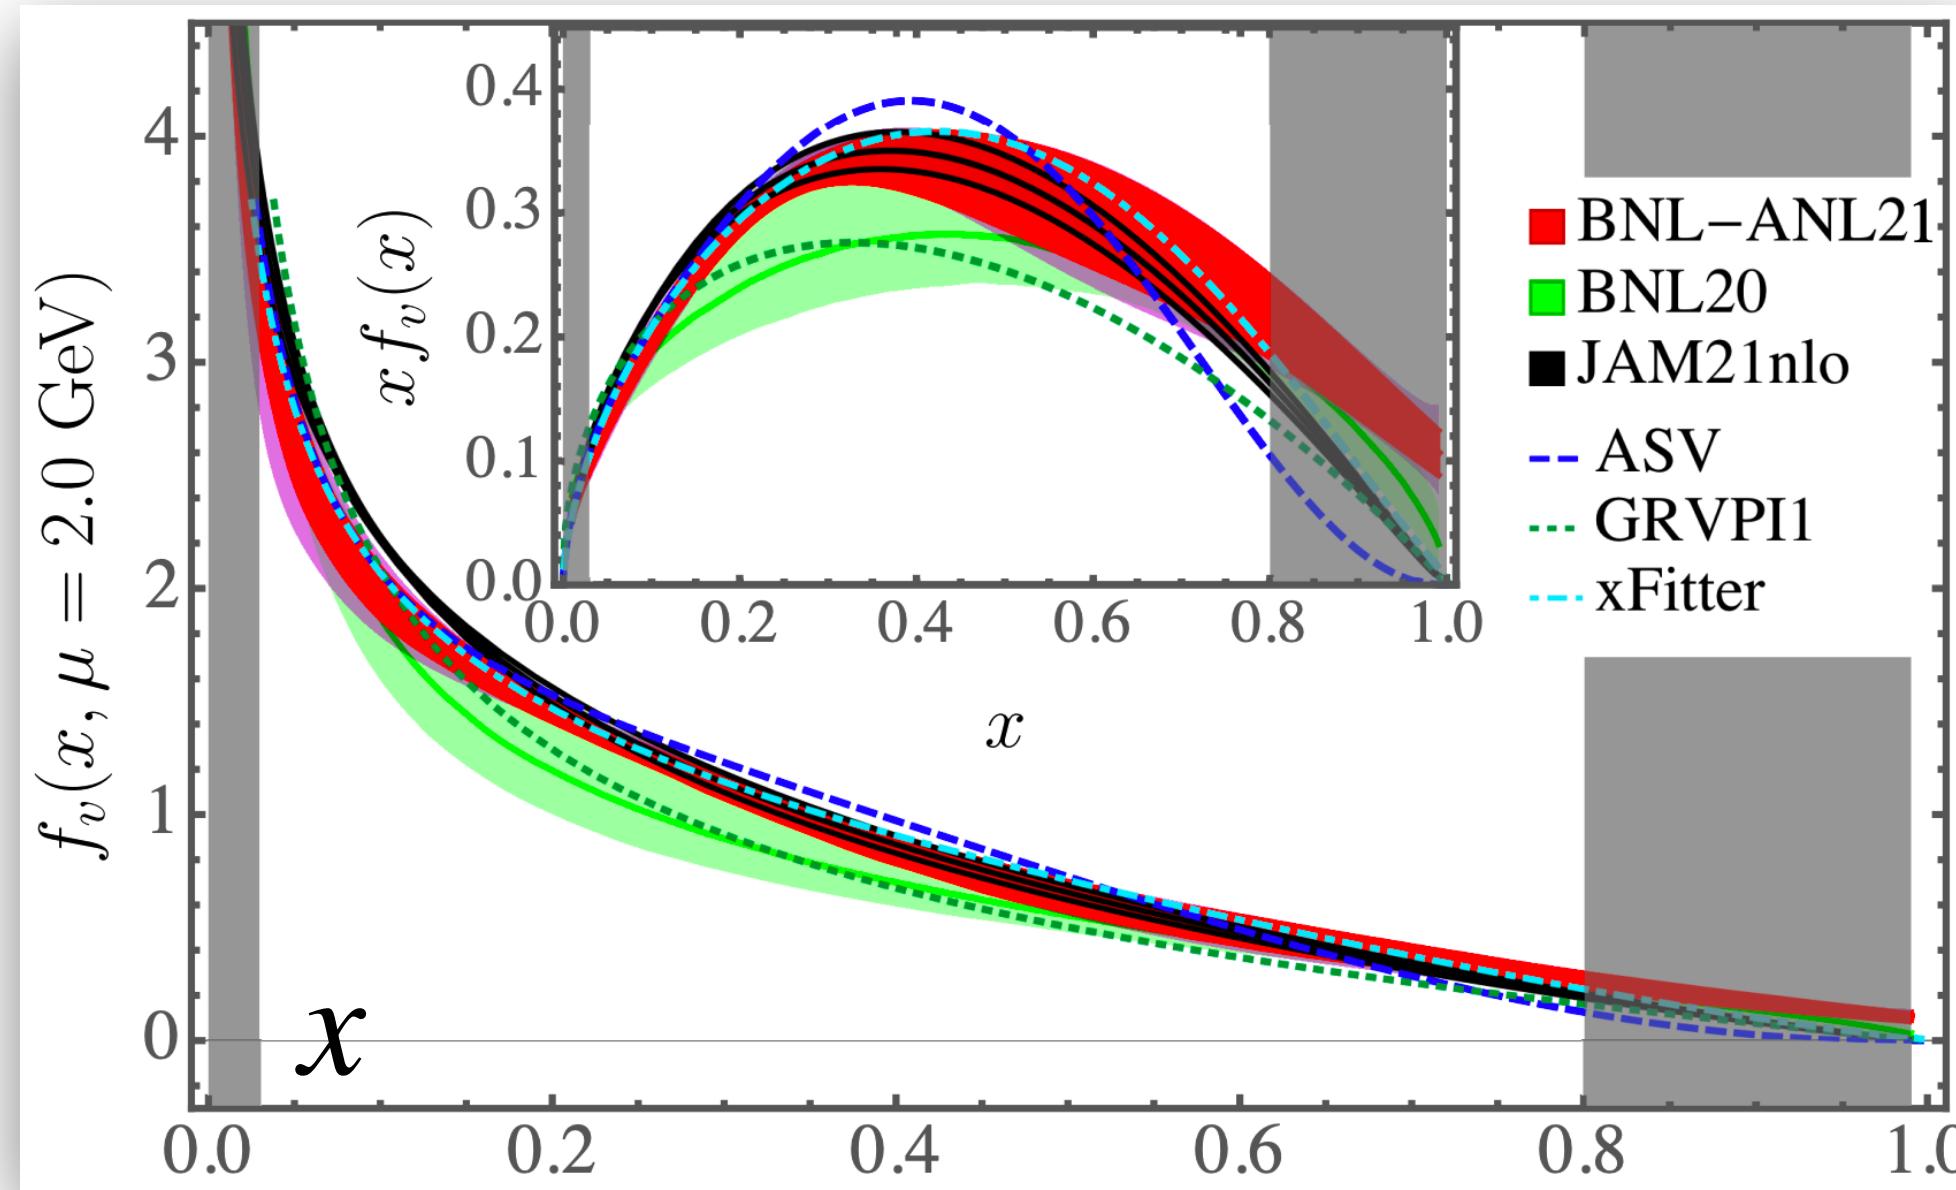

$$t = 0, \quad z \neq 0$$

$$\begin{aligned}
 P^\mu \tilde{h}(z, P_z, \mu) &= \\
 \langle P | \bar{q}(-\frac{z}{2}) \gamma^\mu \mathcal{W}(-\frac{z}{2}, \frac{z}{2}) q(\frac{z}{2}) | P \rangle
 \end{aligned}$$

Parton distributions from lattice

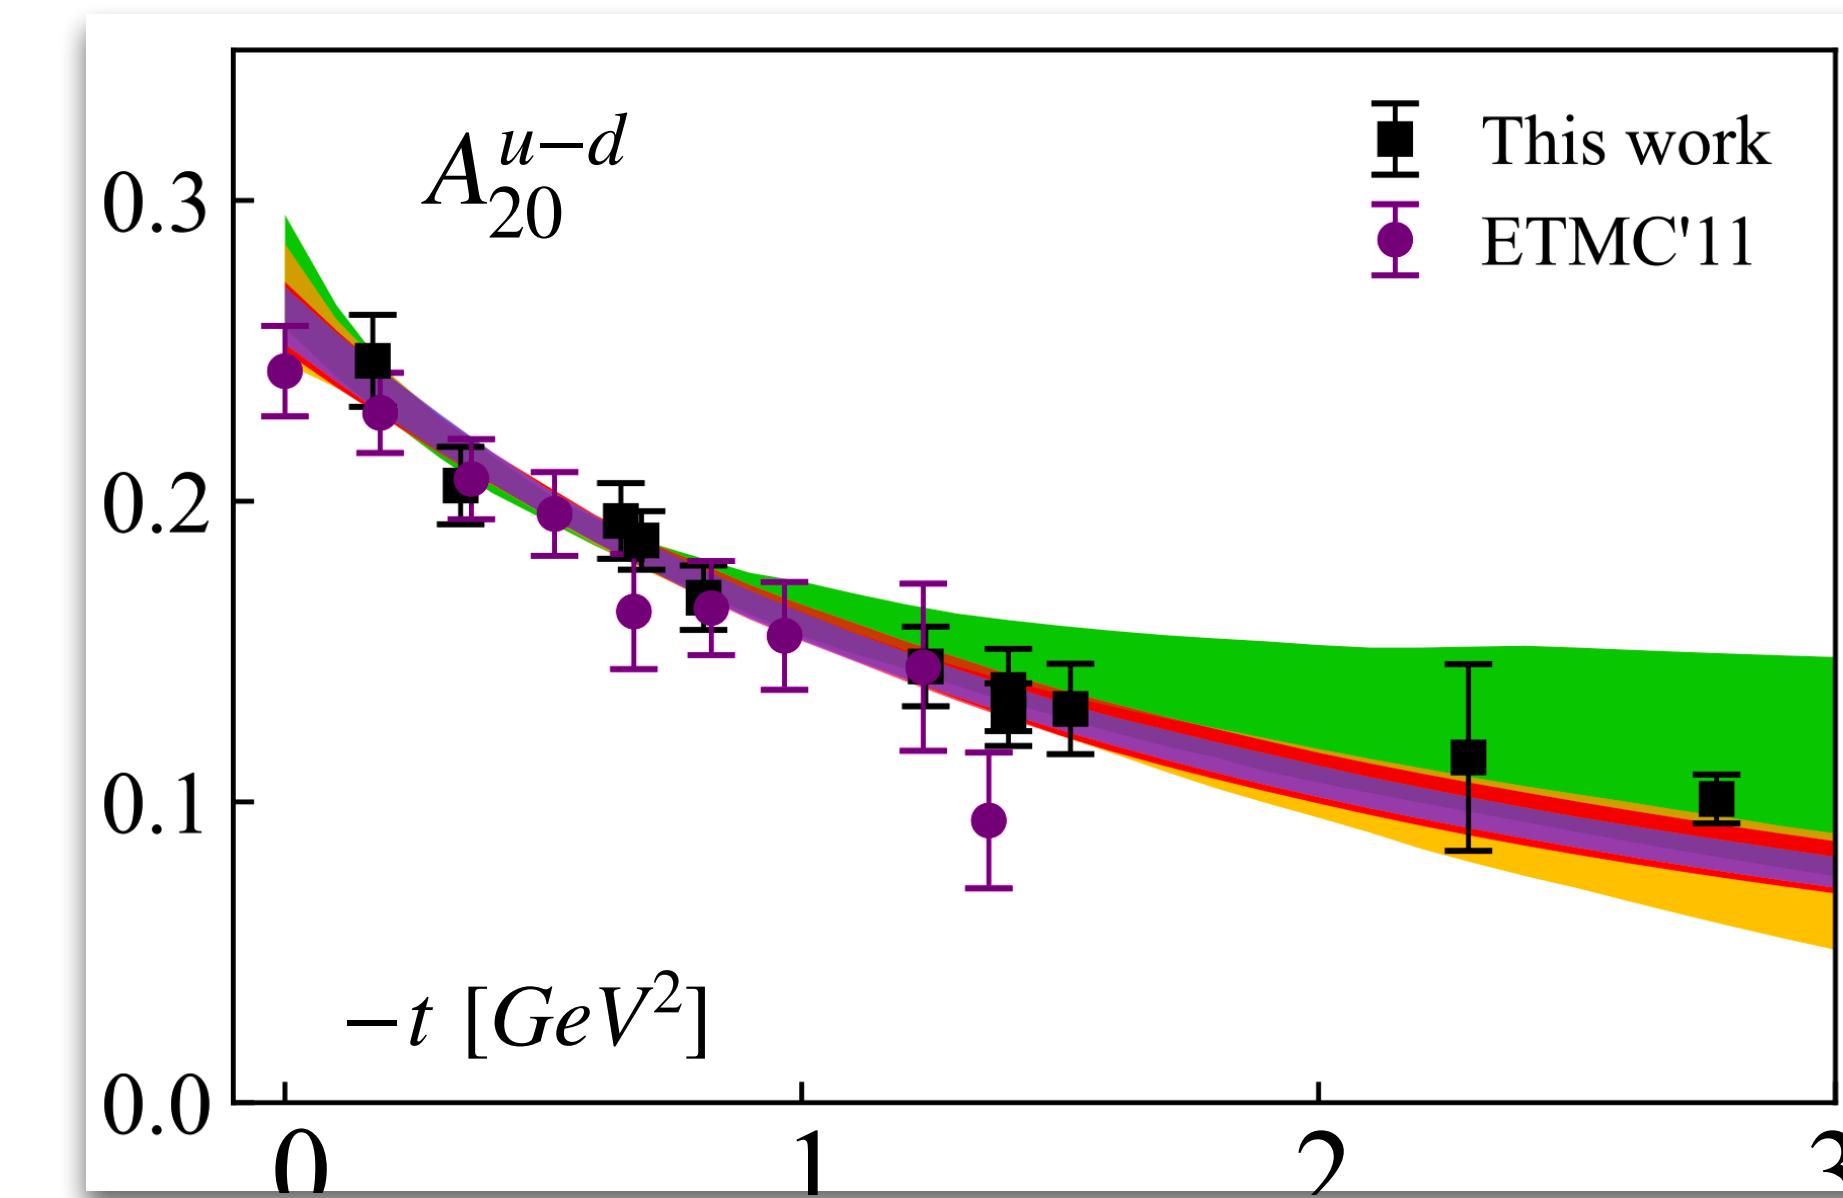

Pion valence quark PDF from LaMET

- XG, Y. Zhao et al., (BNL-ANL21), Phys.Rev.Lett. 128 (2022), 142003

- ▶ Agree with the global analysis at the moderate x region.
- ▶ End-point region can be improved by larger hadron momentum.

Moments of GPDs from SDF

- S. Bhattacharya, XG, et al., Phys.Rev.D 108 (2023) 1, 014507

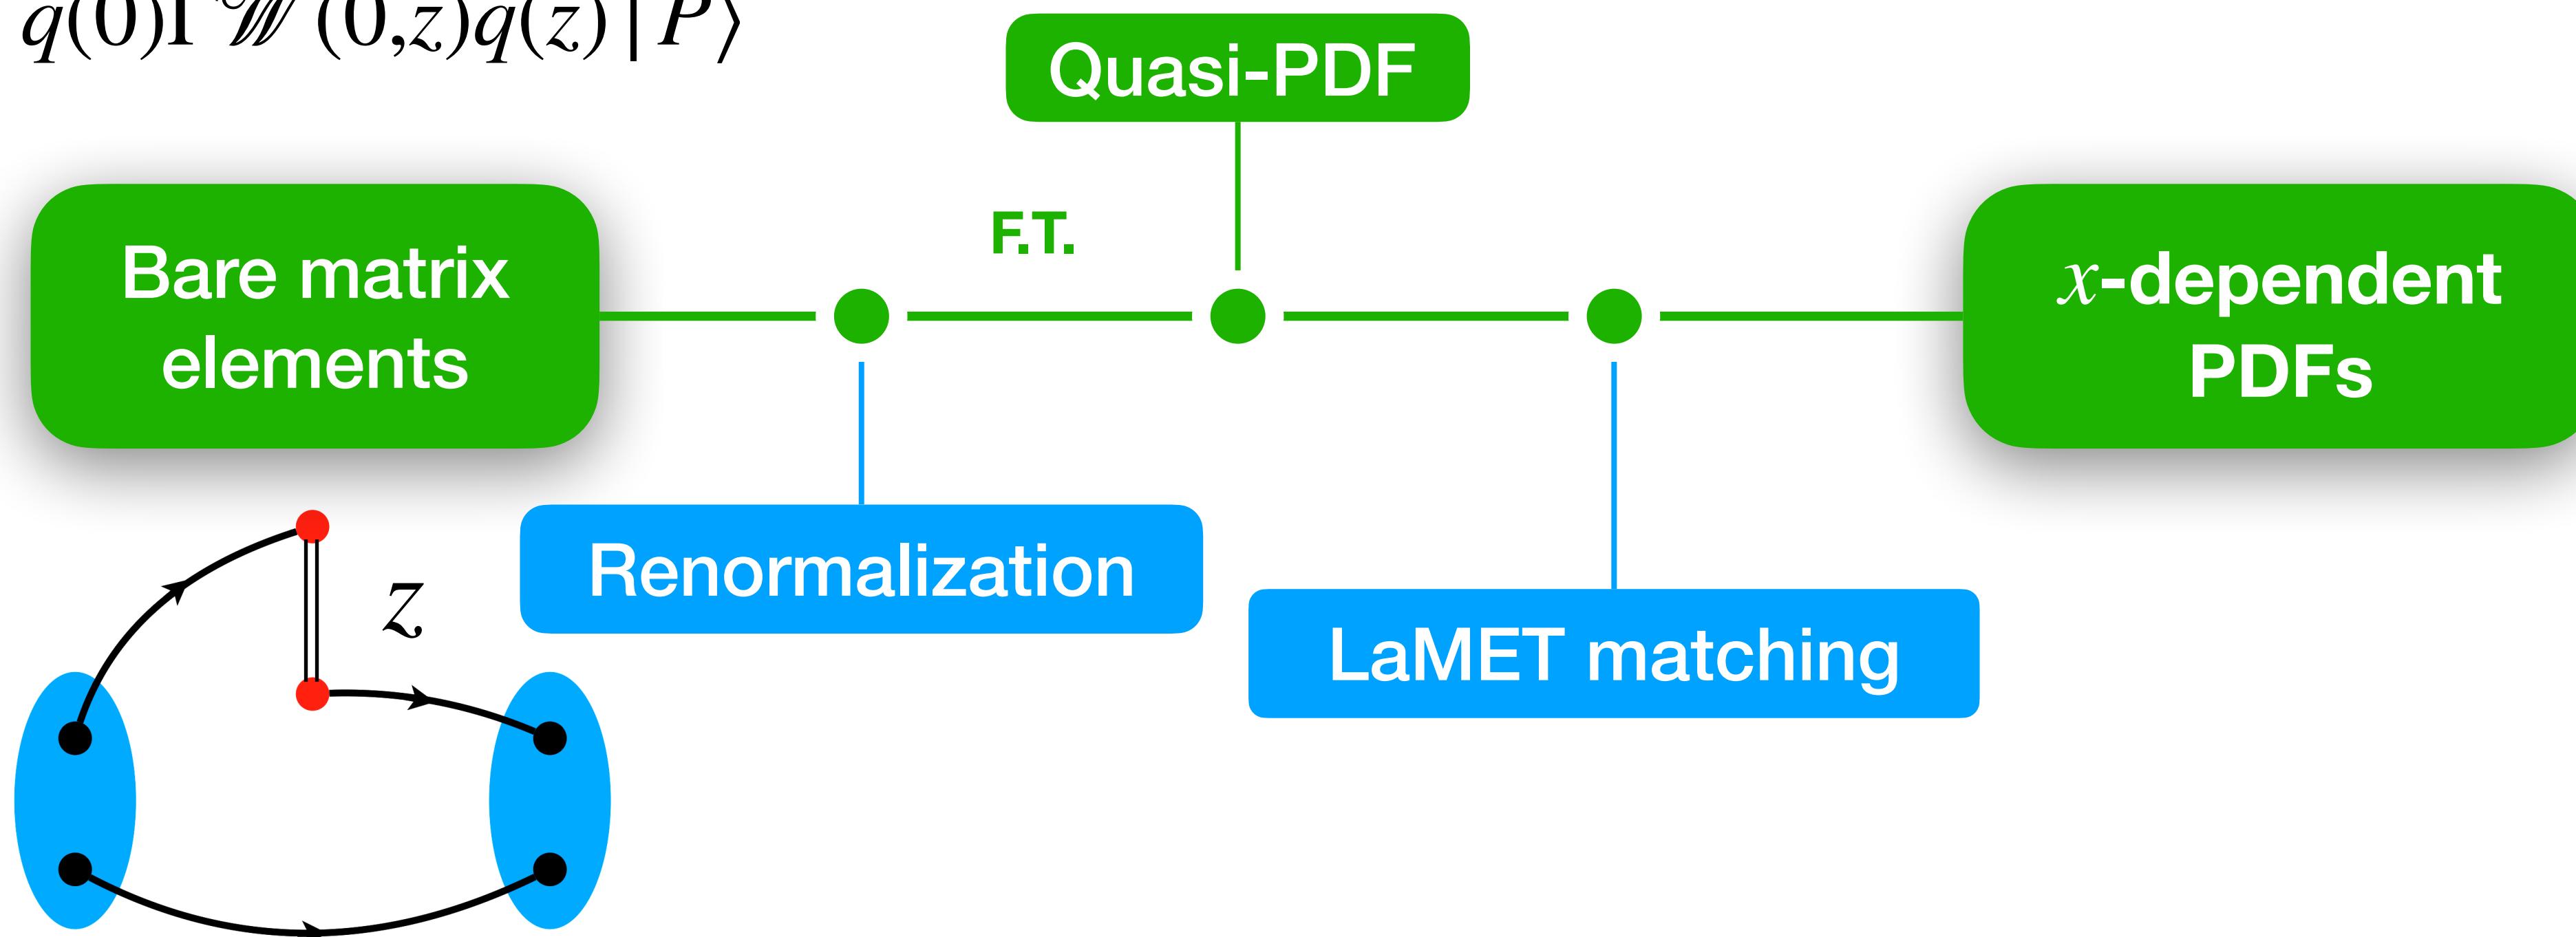

- ▶ Agree with traditional calculations using local operators (ETMC'11).
- ▶ Can systematically extract high moments with large momentum.

Systematic control in LaMET

$$\tilde{q}(x, P_z, \mu) = \int \frac{dy}{|y|} C(\xi, \frac{\mu}{yP_z}) q(y, \mu) + \mathcal{O}(\frac{\Lambda_{QCD}^2}{x^2 P_z^2}, \frac{\Lambda_{QCD}^2}{(1-x)^2 P_z^2})$$

$\xi = x/y$

$$\langle P | \bar{q}(0) \Gamma \mathcal{W}(0, z) q(z) | P \rangle$$

Renormalization

- X. Ji, J. H. Zhang and Y. Zhao, PRL120 (2018)
- J. Green, K. Jansen and F. Steffens, PRL121 (2018)
- T. Ishikawa, et al, PRD 96 (2017)

$= \delta m(a) |z| \propto \frac{|z|}{a}$

The operator can be multiplicatively renormalized:

$$[\bar{\psi}(0)\Gamma W_{\hat{z}}(0,z)\psi(z)]_B \\ = e^{-\delta m|z|} Z(a) [\bar{\psi}(0)\Gamma W_{\hat{z}}(0,z)\psi(z)]_R$$

$$\delta m(a) = m_{-1}(a)/a + \textcolor{red}{m}_0$$

Wilson-line self energy + **renormalon ambiguity**

- Subtract the **linear divergence** from Wilson-line self energy:
 - Self-renormalization.
 - Static potential.
 - ...

$$h^R(z, P_z) = e^{\delta m|z-z_s|} \frac{\tilde{h}(z, P_z, a)}{Z_X(\textcolor{red}{z}_s, P_z^0, a)}$$

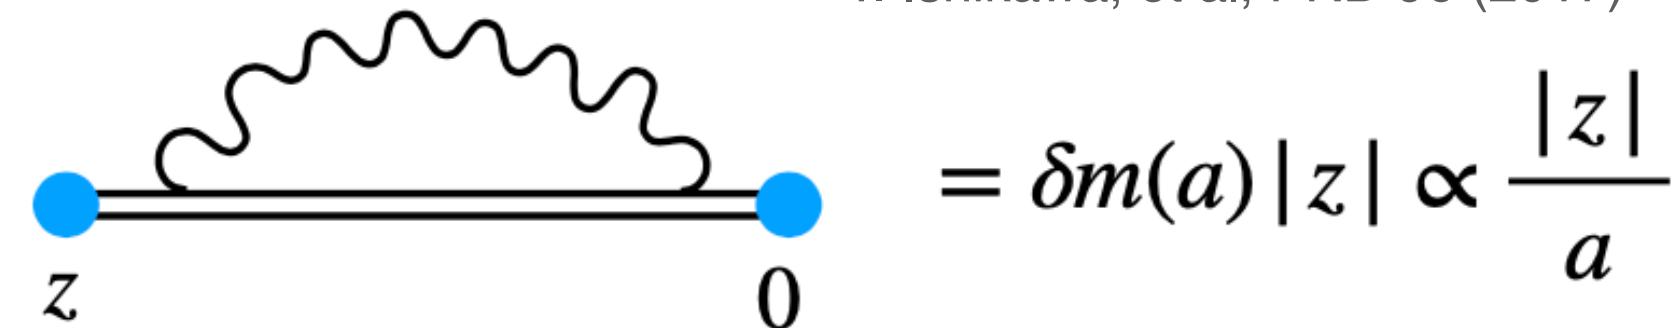

$$h^{R, \text{ lattice}}(z, P_z) \rightarrow h^{R, \overline{\text{MS}}}(z, P_z)$$

• Y. Huo, et al. (LPC), NPB 969 (2021).

• XG, Y. Zhao et al., (BNL/ANL) PRL 128 (2022).

Renormalization

- X. Ji, J. H. Zhang and Y. Zhao, PRL120 (2018)
- J. Green, K. Jansen and F. Steffens, PRL121 (2018)
- T. Ishikawa, et al, PRD 96 (2017)

The operator can be multiplicatively renormalized:

$$[\bar{\psi}(0)\Gamma W_{\hat{z}}(0,z)\psi(z)]_B \\ = e^{-\delta m|z|} Z(a) [\bar{\psi}(0)\Gamma W_{\hat{z}}(0,z)\psi(z)]_R$$

$$\delta m(a) = m_{-1}(a)/a + m_0$$

Wilson-line self energy + renormalon ambiguity

↓

linear power correction $\mathcal{O}(\Lambda_{\text{QCD}}/P_z)$ in qPDF

- Subtract the **linear divergence** from Wilson-line self energy:

- Self-renormalization.

- Static potential.

- ...

- Y. Huo, et al. (LPC), NPB 969 (2021).

- xG, Y. Zhao et al., (BNL/ANL) PRL 128 (2022).

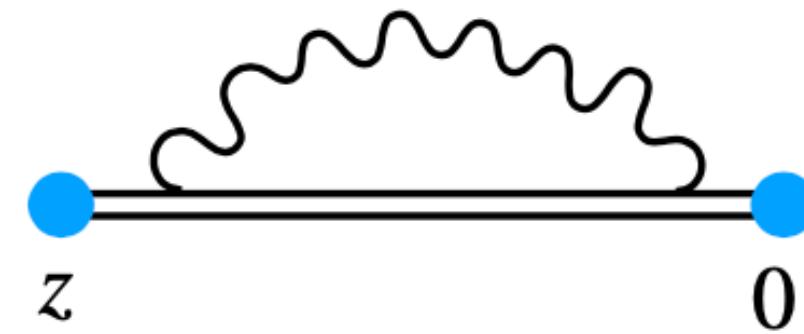

$$h^R(z, P_z) = e^{\delta m|z-z_s|} \frac{\tilde{h}(z, P_z, a)}{Z_X(z_s, P_z^0, a)}$$

- The number of diagrams grows, $r_n \sim n!$: diverge in **perturbation theory** at any α_s .

$$\delta m = \frac{1}{a} \sum \alpha_s^{n+1}(a) r_n$$

Renormalization

- X. Ji, J. H. Zhang and Y. Zhao, PRL120 (2018)
- J. Green, K. Jansen and F. Steffens, PRL121 (2018)
- T. Ishikawa, et al, PRD 96 (2017)

$$= \delta m(a) |z| \propto \frac{|z|}{a}$$

The operator can be multiplicatively renormalized:

$$\begin{aligned} & [\bar{\psi}(0)\Gamma W_{\hat{z}}(0,z)\psi(z)]_B \\ & = e^{-\delta m|z|} Z(a) [\bar{\psi}(0)\Gamma W_{\hat{z}}(0,z)\psi(z)]_R \end{aligned}$$

$$\delta m(a) = m_{-1}(a)/a + \textcolor{red}{m}_0$$

Wilson-line self energy + **renormalon ambiguity**

- Subtract the **linear divergence** from Wilson-line self energy:

- Self-renormalization. • Y. Huo, et al. (LPC), NPB 969 (2021).
- Static potential. • XG, Y. Zhao et al., (BNL/ANL) PRL 128 (2022).
- ...

- Subtract the **renormalon ambiguity** from a resummation prescription:

$$h^{R, \text{ lattice}}(z, P_z = 0)$$

$$= C_0^{\overline{\text{MS}}, \text{ LRR}}(z, P_z = 0) e^{-\textcolor{red}{m}_0|z|}$$

LRR: leading renormalon resummation

$$\mathcal{O}(\Lambda_{\text{QCD}} \cancel{P_z}) + \mathcal{O}(\Lambda_{\text{QCD}}^2 / P_z^2)$$

- J. Holligan, et al., (UMD) NPB 993 (2023).
- R. Zhang, et al., (UMD) PLB 844 (2023).

LaMET matching

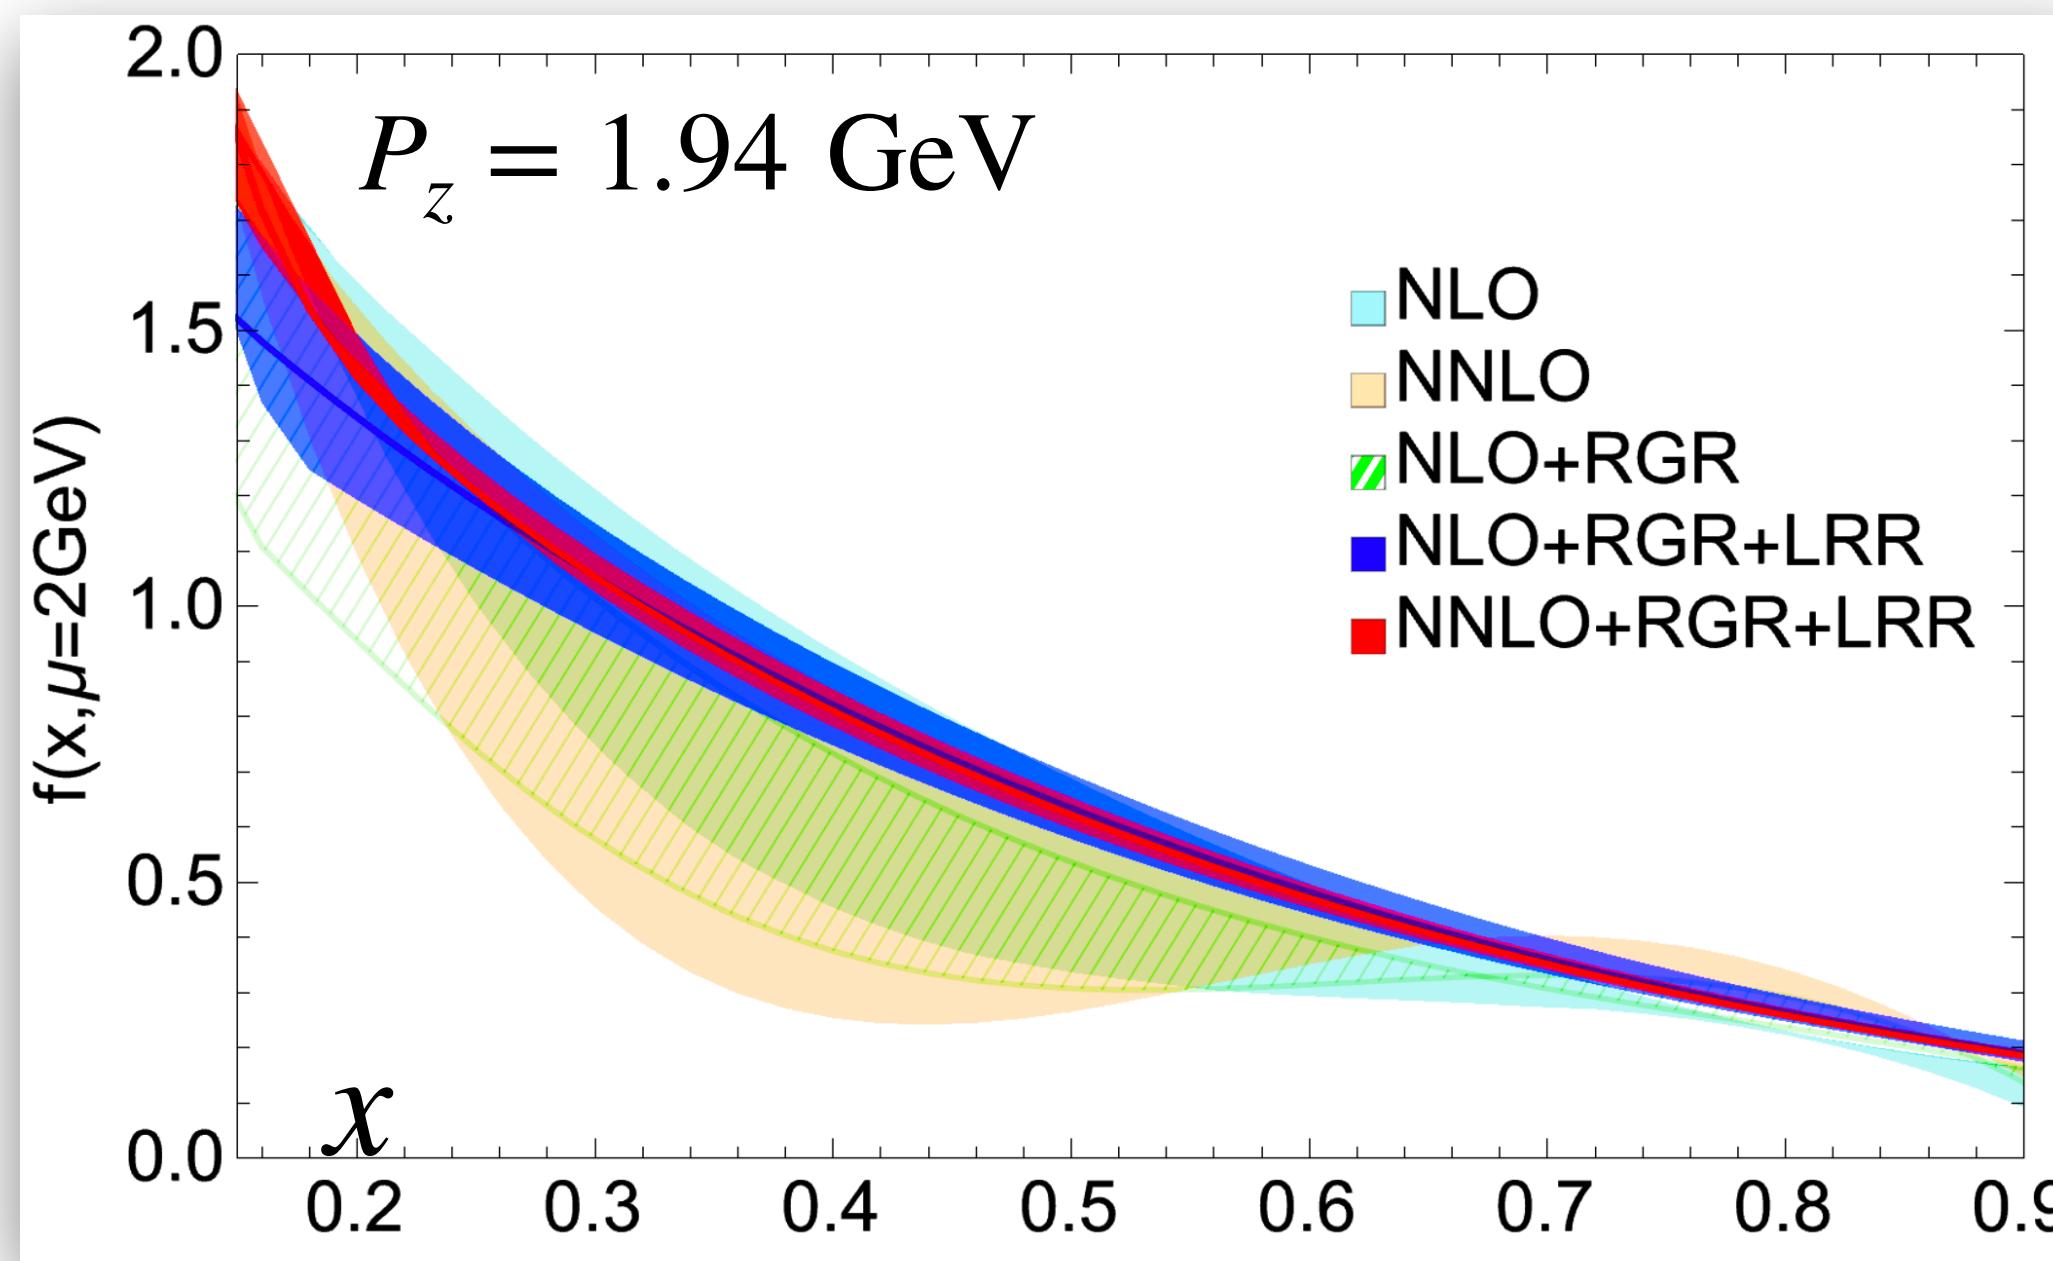

$$\lim_{\xi \rightarrow 1} C \left(\xi, \frac{\mu}{P_z} \right) = 1 + \frac{\alpha_s(\mu) C_F}{2\pi} \left[2 \frac{\ln |1 - \xi|}{|1 - \xi|} - \frac{2}{1 - \xi} \ln \frac{\mu^2}{(2xP_z)^2} \theta(1 - \xi) + \frac{3}{2|1 - \xi|} \right] + \mathcal{O}(\alpha_s^2)$$

$\xi = x/y$

- Next-to-next-to-leading order (NNLO) kernel.
 - L.-B. Chen, et al., Phys. Rev. Lett. 126 (2021) 072002
 - Z.-Y. Li, et al., Phys. Rev. Lett. 126 (2021) 072001
- Resummation of DGLAP (RG) logs $\ln(\mu^2/(2xP_z)^2)$.
 - XG, Y. Zhao et al. (BNL), Phys.Rev.D 103 (2021), 094504
 - Y.S. Su, et al., Nucl.Phys.B 991 (2023) 116201
- Resummation of large-x (threshold) logarithms $\ln |1 - \xi| / |1 - \xi|$.
 - XG, Y. Zhao et al. (BNL), Phys.Rev.D 103 (2021), 094504
 - X. Ji, et al., JHEP 08 (2023) 037
- Resummation/subtraction of leading renormalon.
 - J. Holligan, et al., (UMD) NPB 993 (2023).
 - R. Zhang, et al., (UMD) PLB 844 (2023).

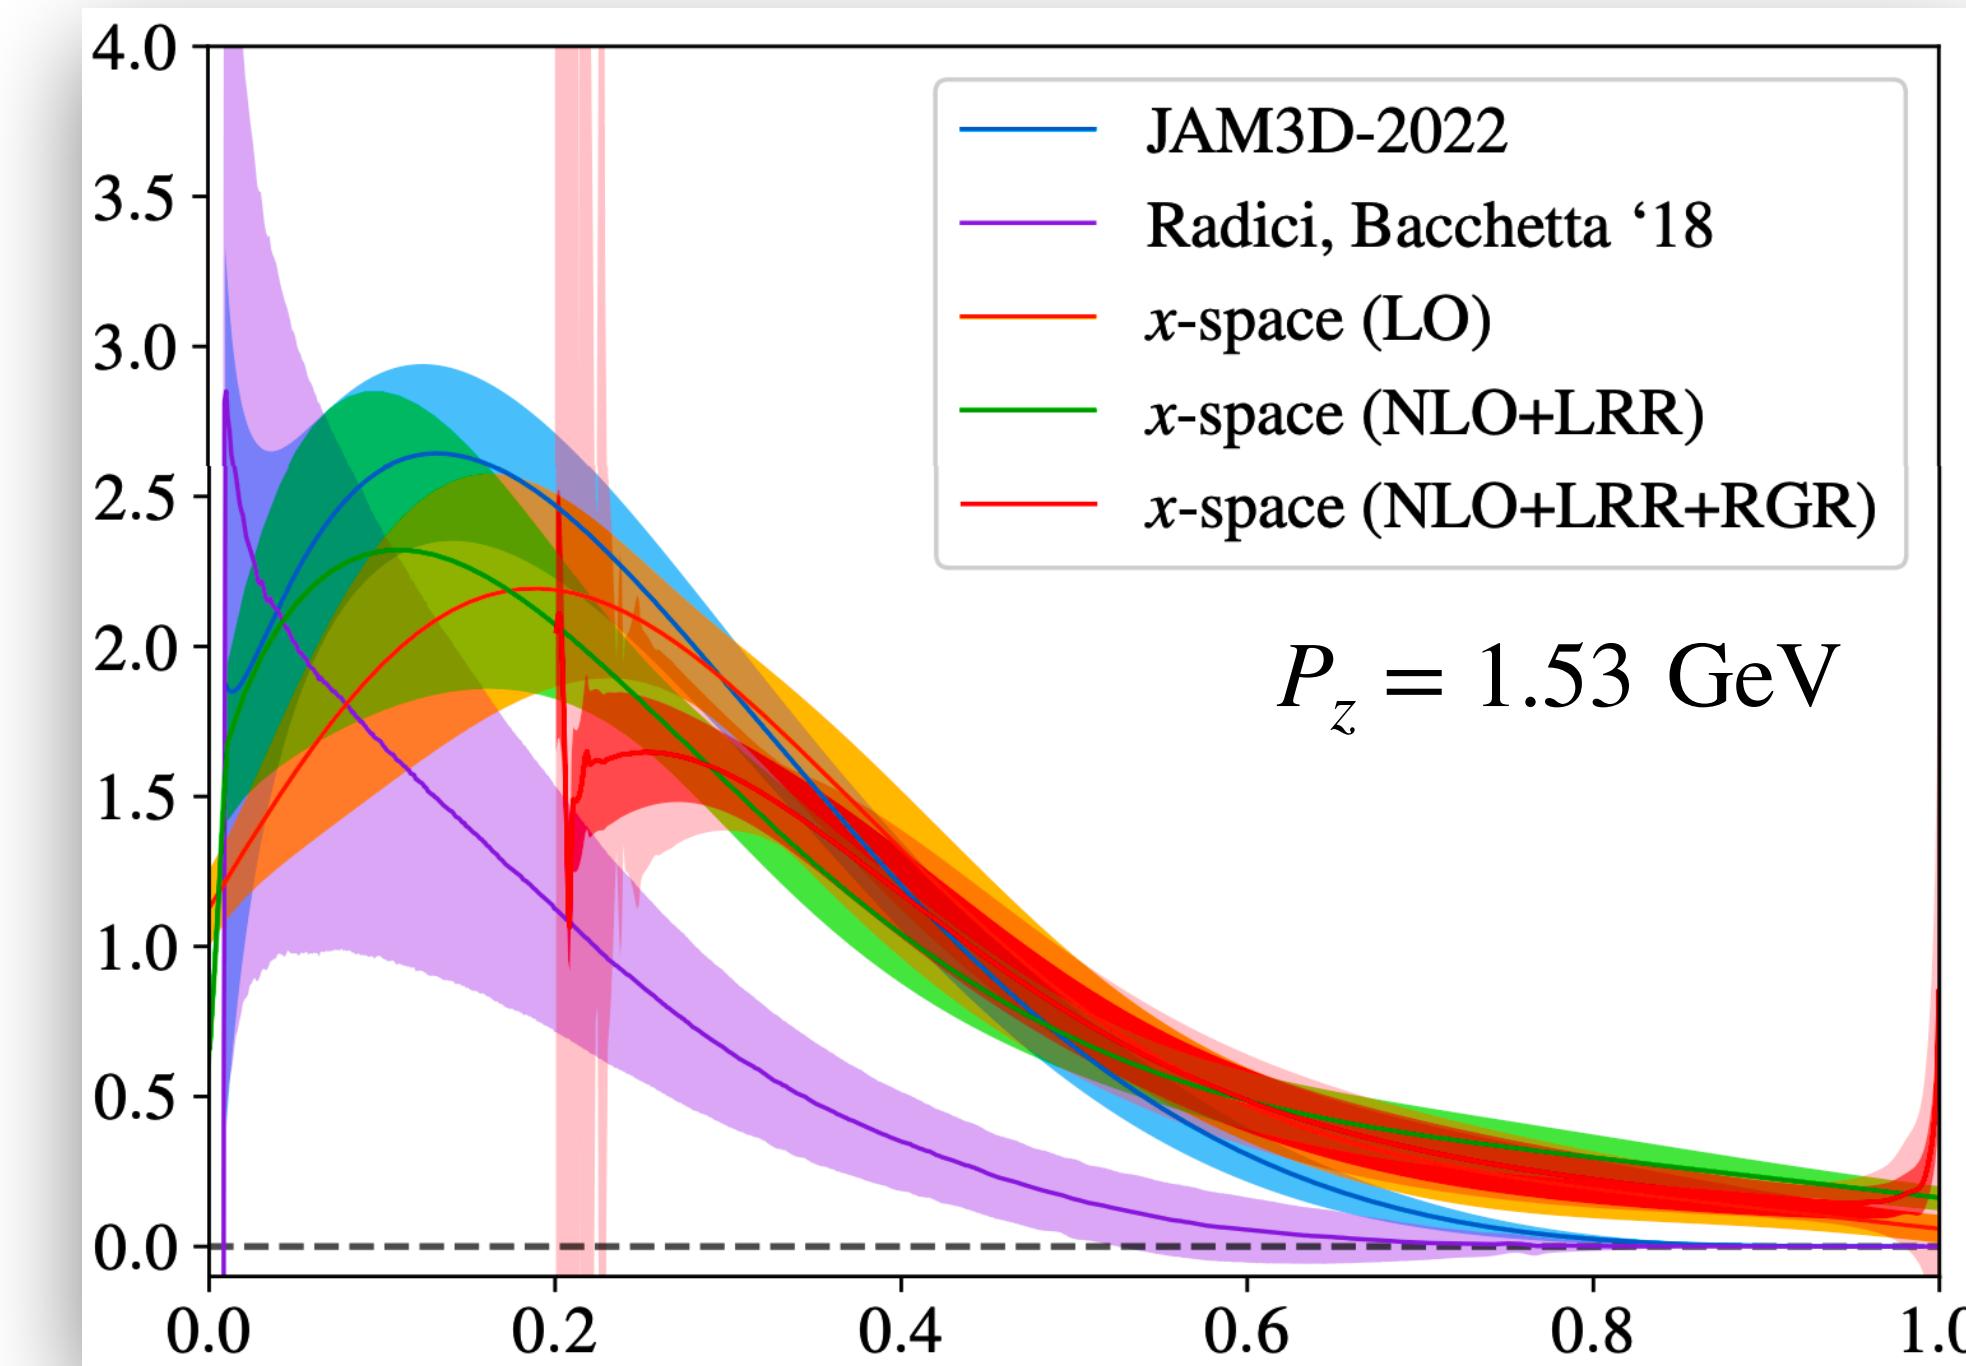

PDFs from LaMET with improved precision

- Pion valence quark PDF

• R. Zhang, et al., (UMD) PLB 844 (2023).

- Nucleon transversity PDF

• XG, A. Hanlon, et al., (BNL+ANL), arXiv: 2310.19047

- ▶ **Leading renormalon resummation (LRR):** remove the linear power correction $\mathcal{O}(\Lambda_{\text{QCD}}/P_z)$, reduces the (theoretical) uncertainty.
- ▶ **DGLAP (RGR):** enhances the accuracy of the scale evolution at **moderate x** , also indicate the perturbative matching is unreliable at **small x** ($2xP_z \sim \Lambda_{\text{QCD}}$).

Universality in LaMET

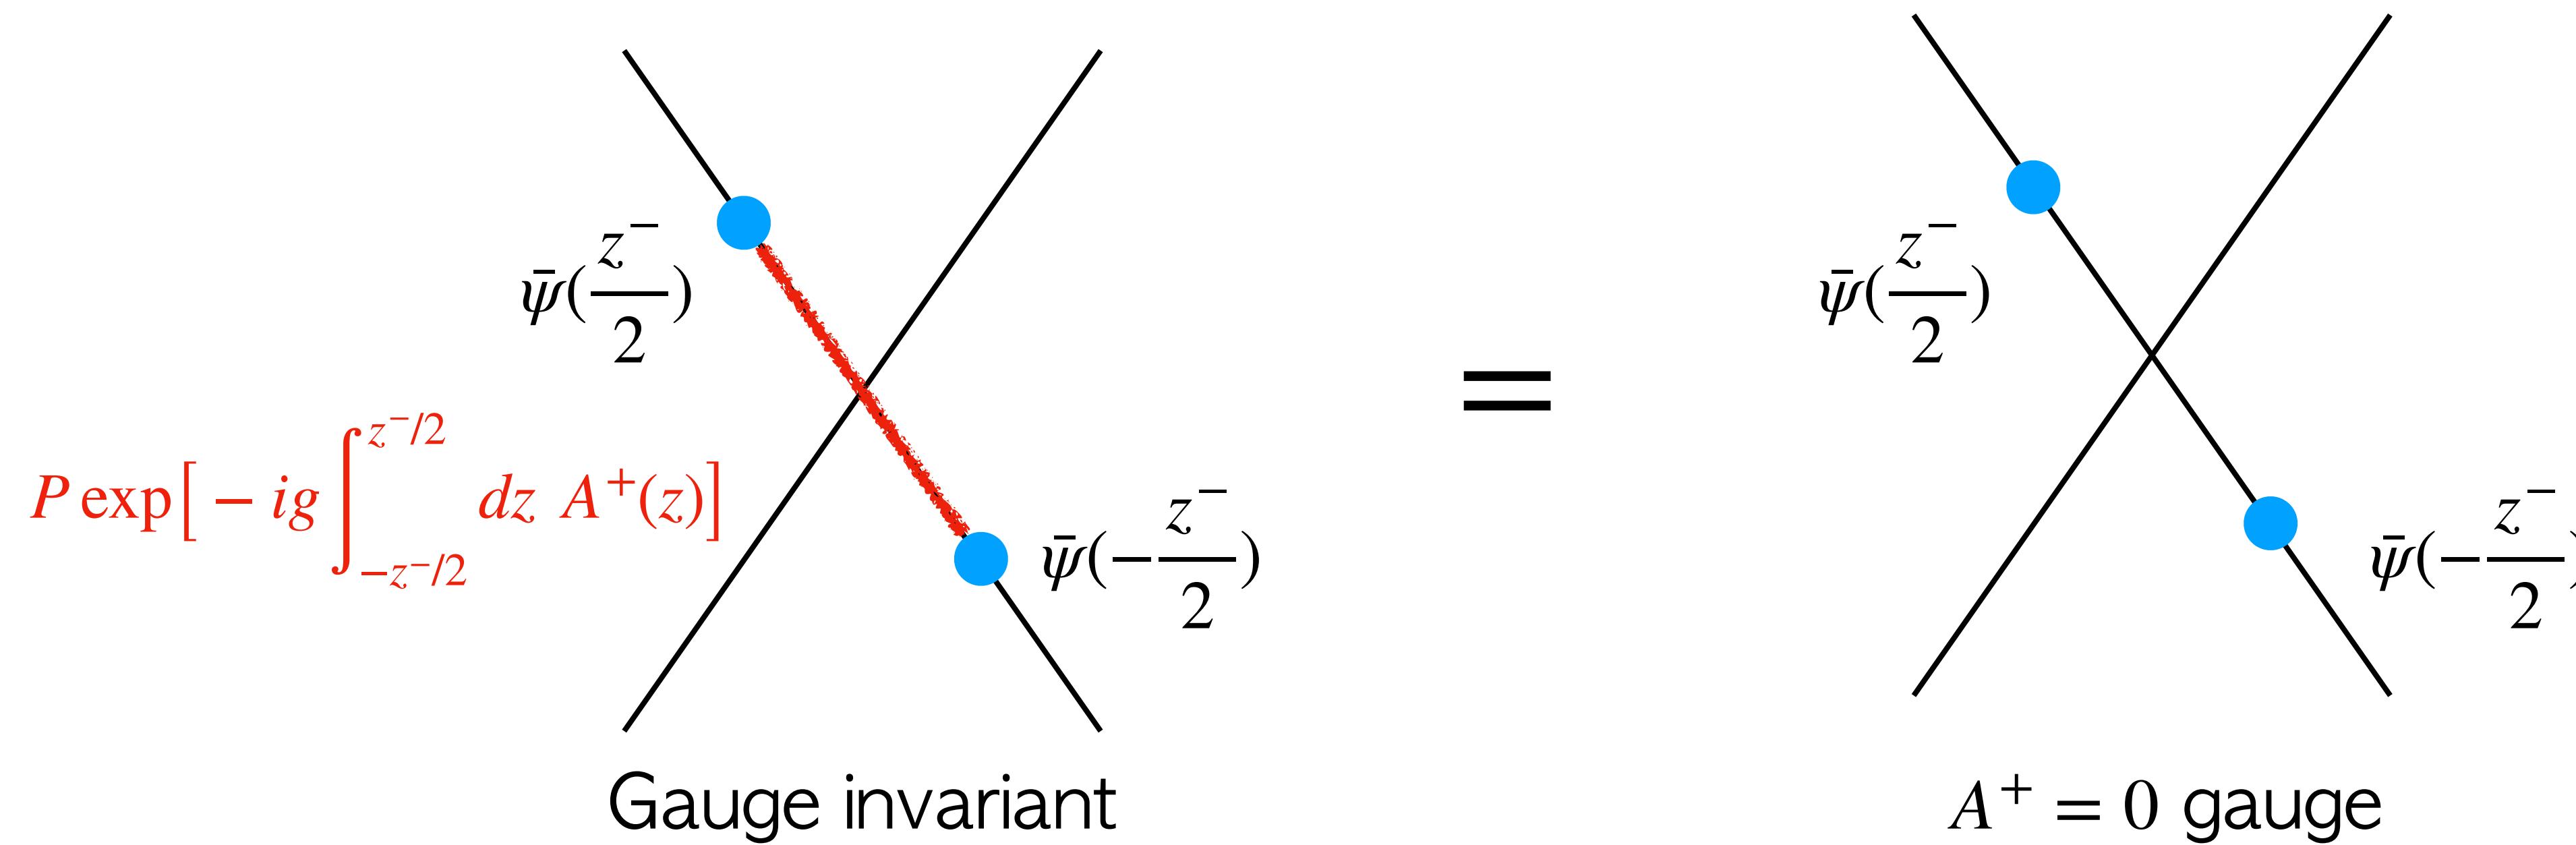

- The non-local operator in gauge theory:

$$\bar{\psi}^*(-\frac{z}{2}) \Gamma \psi^*(\frac{z}{2})$$

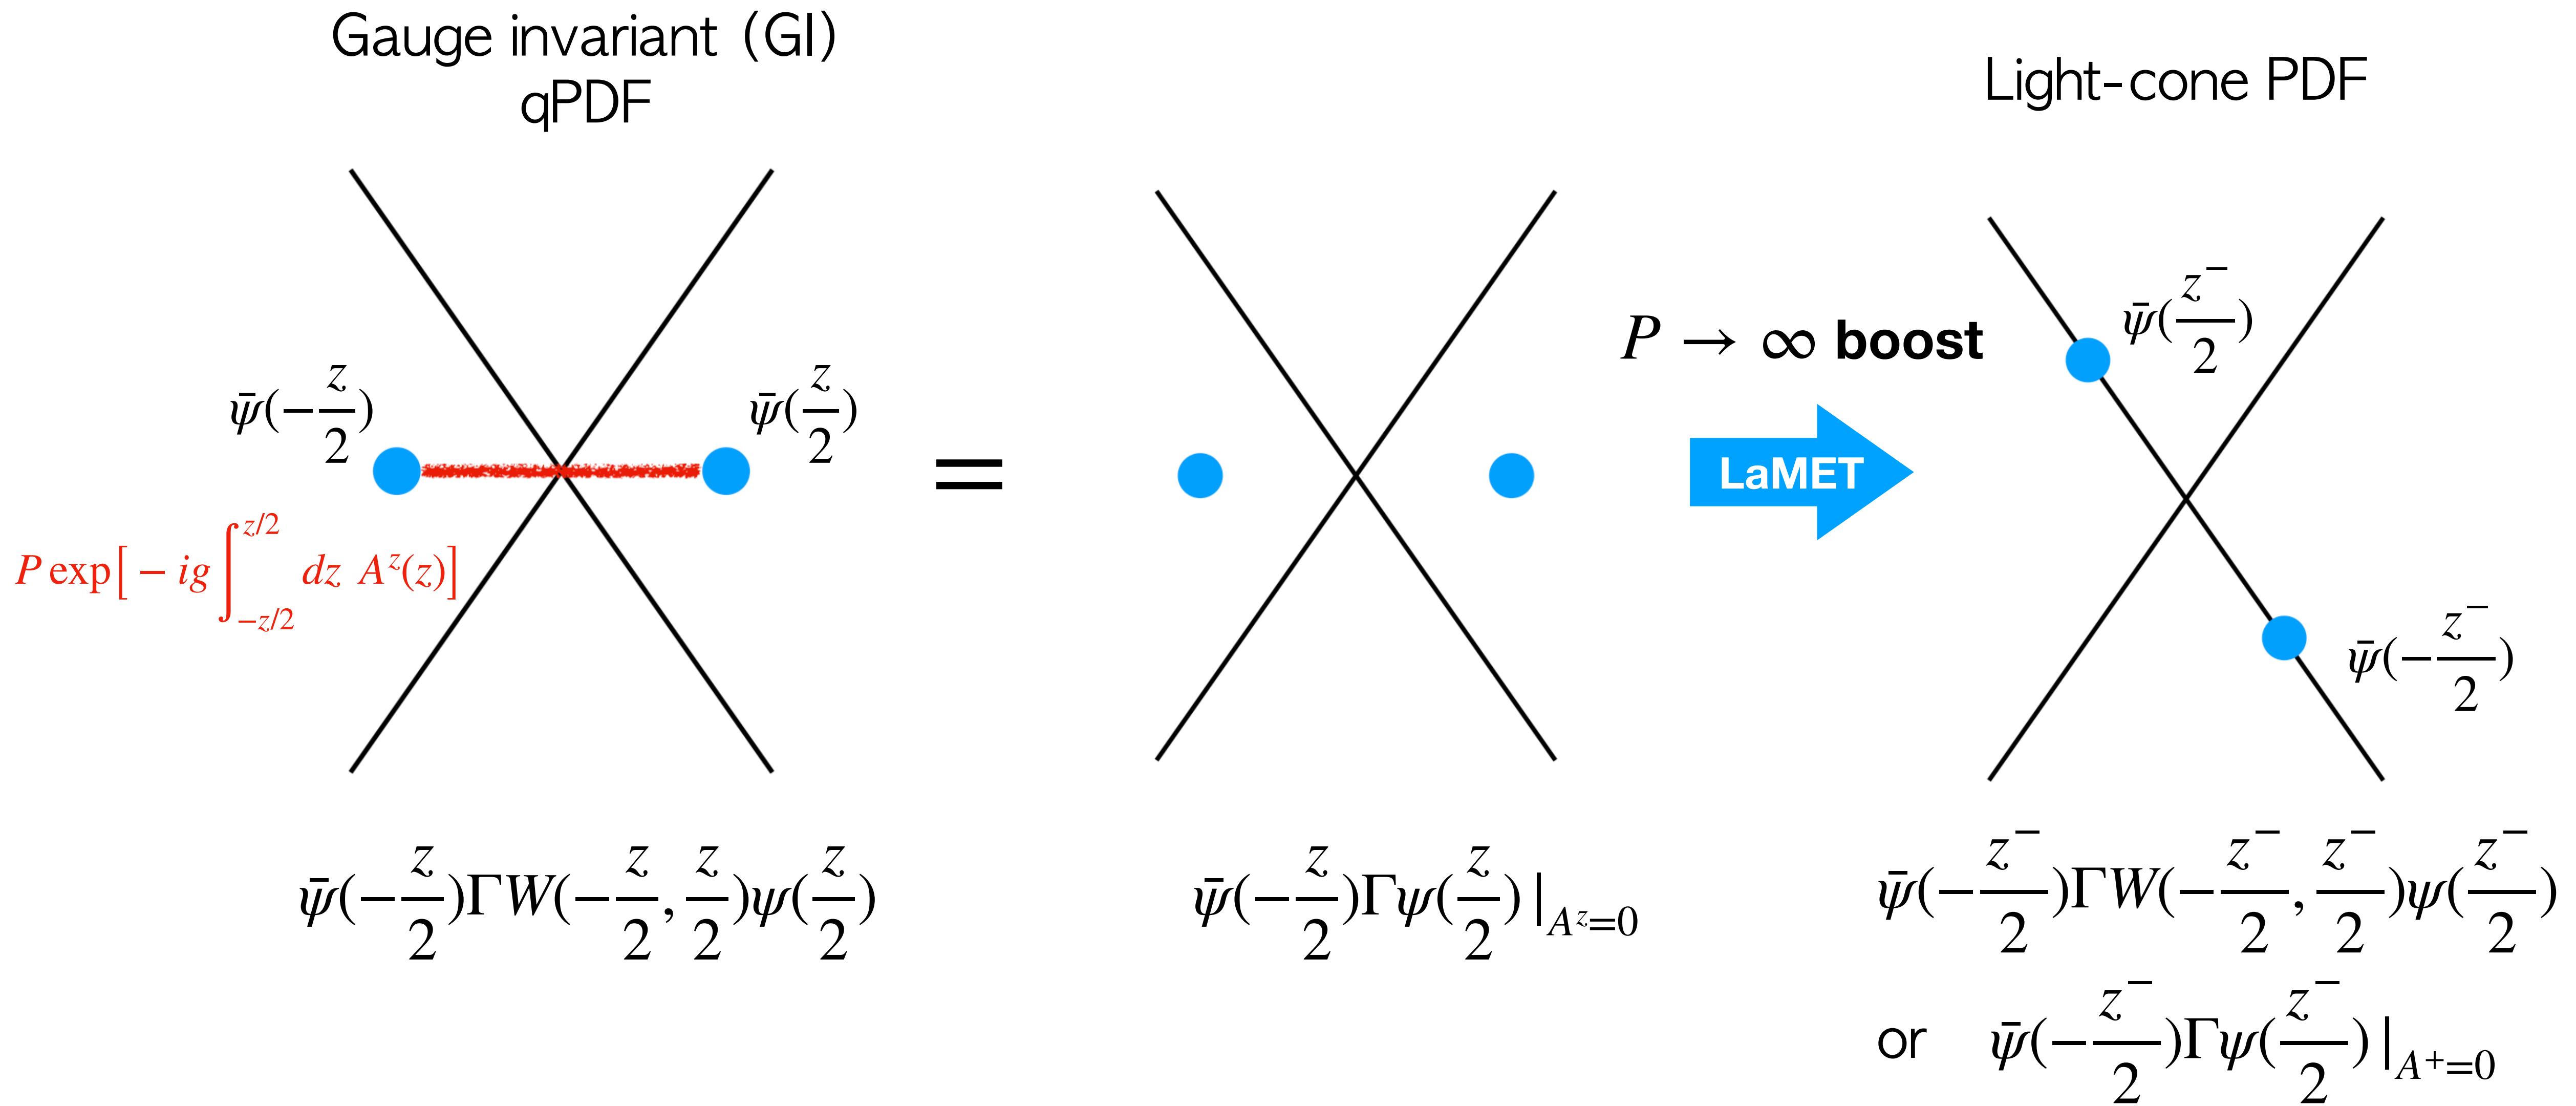

with $\psi^*(z) = \psi(z)e^{iC(z)}$ and $C(z)$ is a linear function of A_μ .

• P. A. M. Dirac, Can.J.Phys. 33 (1955) 650

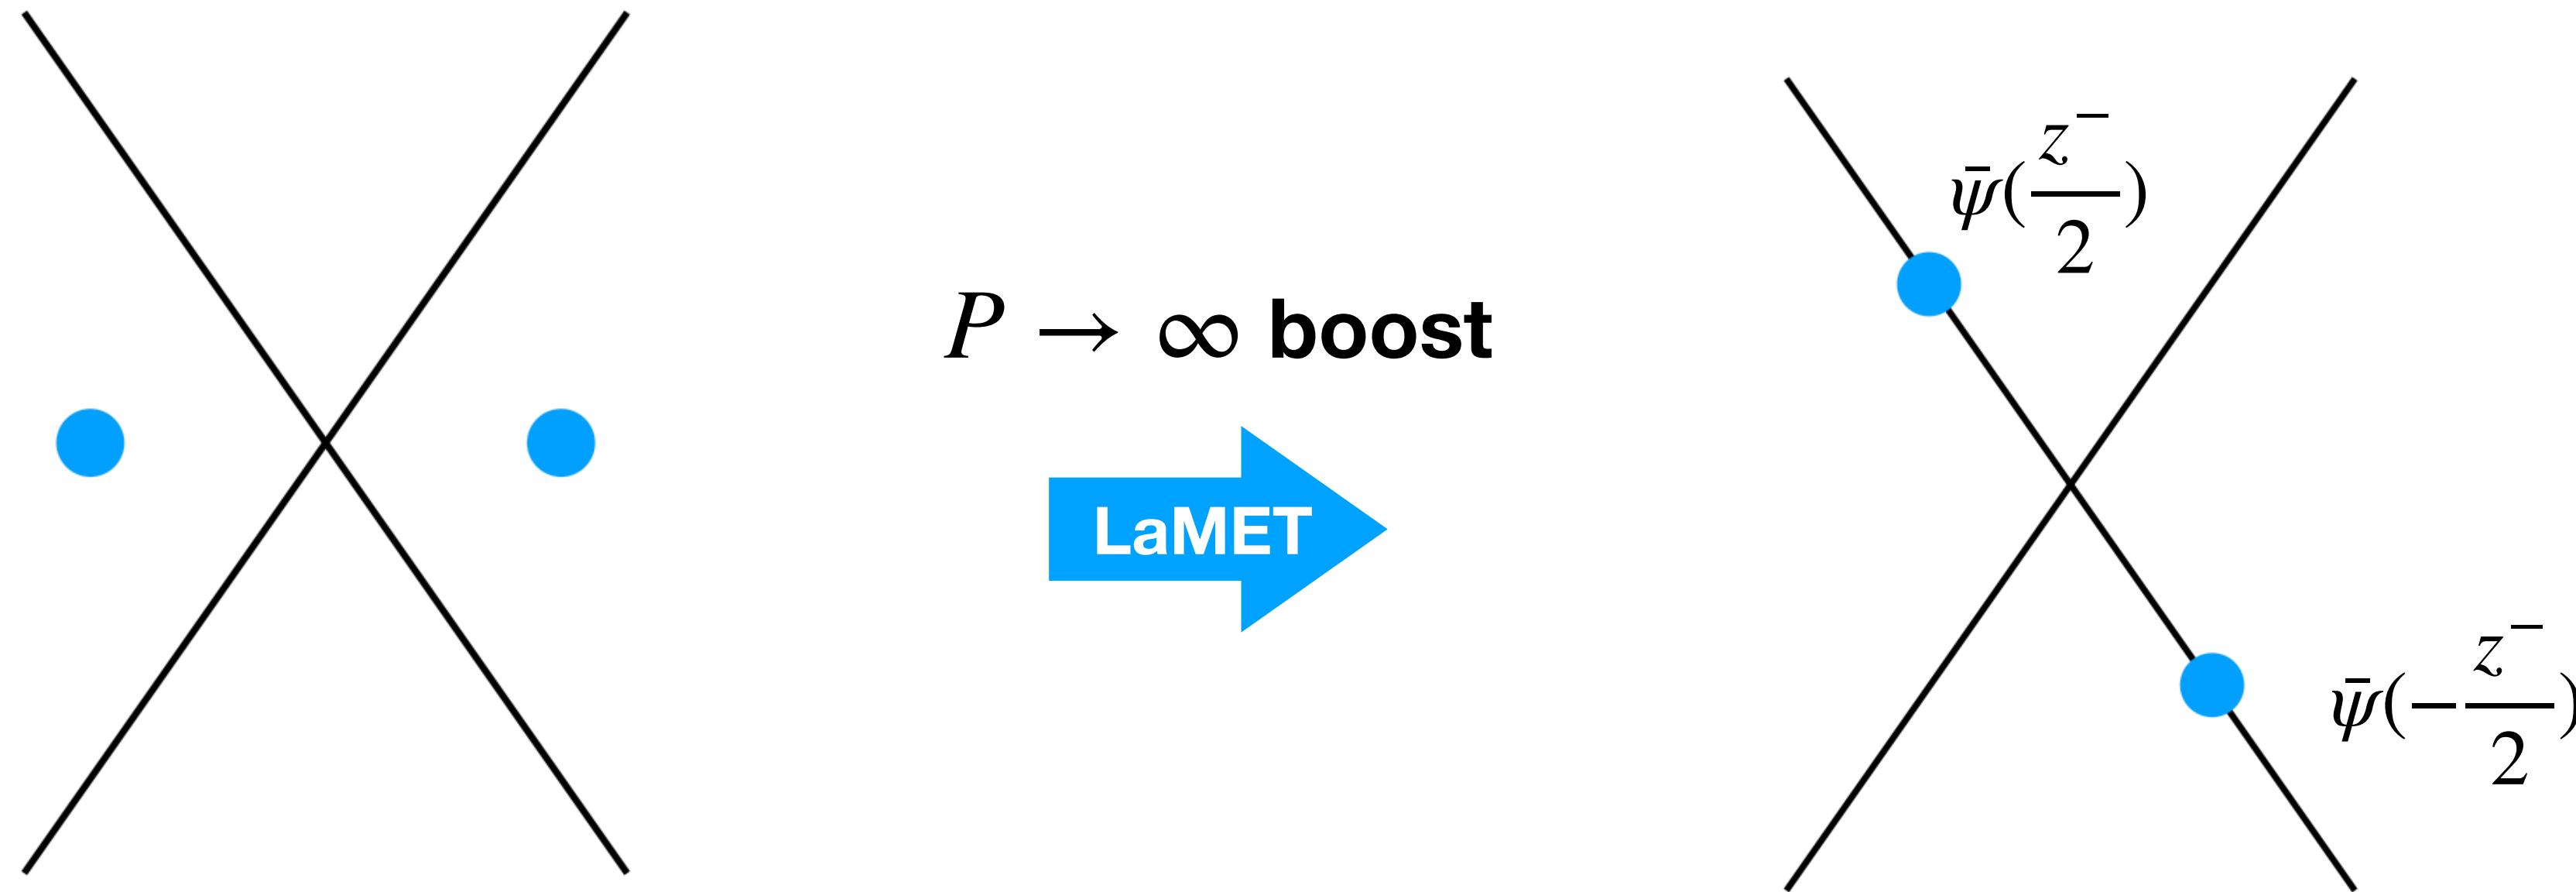

- In DIS, the physical quark $\psi(z)e^{iC(z)}$ represents a gauge-invariant object with **a gauge link extended to infinity along the light-cone direction**:

Universality in LaMET

Universality in LaMET

Physical gauge like: A^z, A^0 ,
 Coulomb gauge $\vec{\nabla} \cdot \vec{A} = 0$

$$\bar{\psi}\left(-\frac{z^-}{2}\right) \Gamma W\left(-\frac{z^-}{2}, \frac{z^-}{2}\right) \psi\left(\frac{z^-}{2}\right)$$

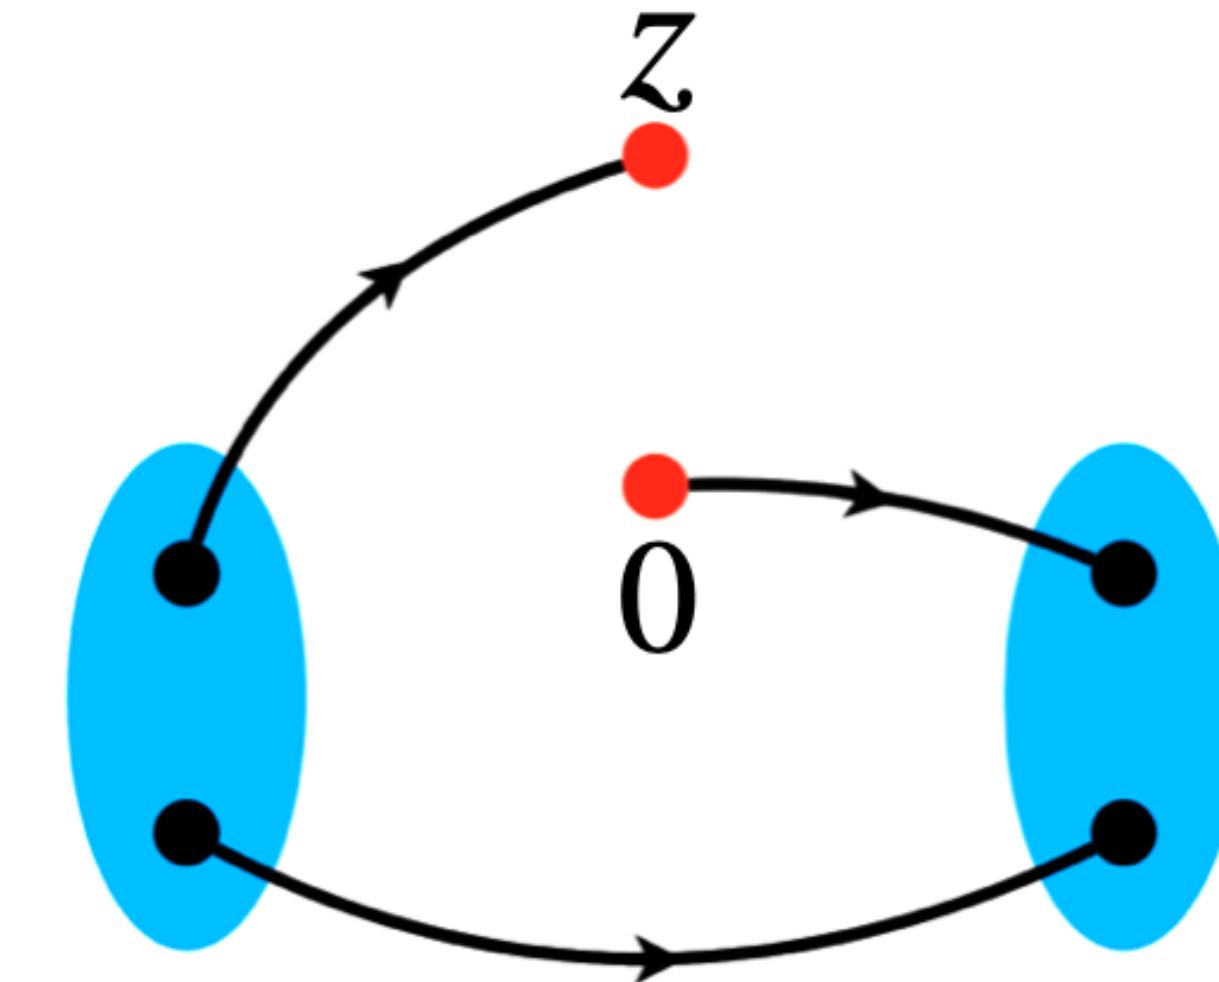

or $\bar{\psi}\left(-\frac{z^-}{2}\right) \Gamma \psi\left(\frac{z^-}{2}\right) |_{A^+ = 0}$

LaMET in Coulomb gauge

- Quasi-PDF in Coulomb gauge (CG):

$$\tilde{f}(x, P^z, \mu) = P^z \int_{-\infty}^{\infty} \frac{dz}{2\pi} e^{ixP^z z} \tilde{h}(z, P^z, \mu)$$

$$\tilde{h}(z, P^z, \mu) = \frac{1}{2P^t} \langle P | \bar{\psi}(z) \gamma^t \psi(0) \Big|_{\vec{\nabla} \cdot \vec{A}=0} |P\rangle$$

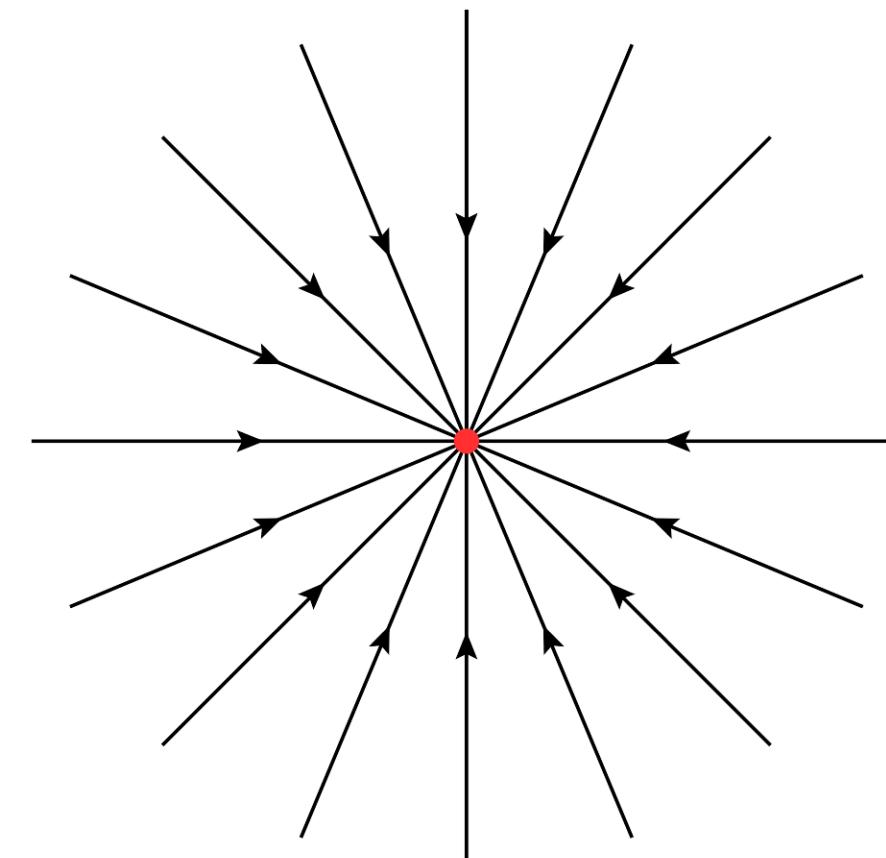

- First proposed in the lattice calculation of gluon helicity

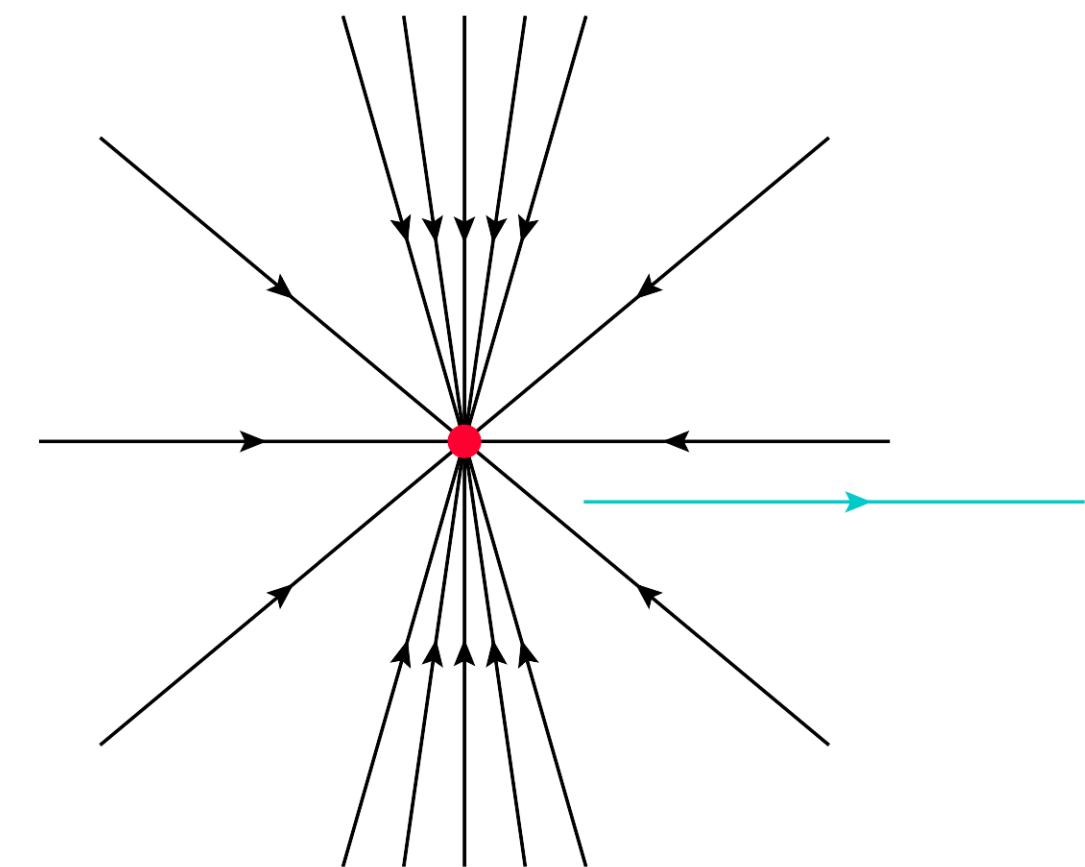

$$\Delta G = \langle P_\infty | (\mathbf{E} \times \mathbf{A})^3 |_{\nabla \cdot \mathbf{A}=0} | P_\infty \rangle$$

- X. Ji, J.-H. Zhang and Y. Zhao, PRL 111 (2013);
- Y. Hatta, X. Ji, and Y. Zhao, PRD 89 (2014);
- X. Ji, J.-H. Zhang and Y. Zhao, PLB 743 (2015);
- Y.-B. Yang, R. Sufian, Y. Zhao, et al. PRL 118 (2017)

Static charge

Moving charge

LaMET factorization

$$\tilde{q}(x, P_z, \mu) = \int \frac{dy}{|y|} C\left(\xi, \frac{\mu}{yP_z}\right) q(y, \mu) + \mathcal{O}\left(\frac{\Lambda_{QCD}^2}{x^2 P_z^2}, \frac{\Lambda_{QCD}^2}{(1-x)^2 P_z^2}\right)$$

$$\xi = x/y$$

- One-loop matching:

$$C\left(\xi, \frac{\mu}{p^z}\right) = \delta(\xi - 1) + \frac{\alpha_s C_F}{2\pi} C^{(1)}\left(\xi, \frac{\mu}{p^z}\right) + \mathcal{O}(\alpha_s^2)$$

$$C^{(1)}\left(\xi, \frac{\mu}{p^z}\right) = C_{\text{ratio}}^{(1)}\left(\xi, \frac{\mu}{p^z}\right) + \frac{1}{2|1-\xi|} + \delta(1-\xi) \left[-\frac{1}{2} \ln \frac{\mu^2}{4p_z^2} + \frac{1}{2} - \int_0^1 d\xi' \frac{1}{1-\xi'} \right]$$

$$C_{\text{ratio}}^{(1)}\left(\xi, \frac{\mu}{p^z}\right) = \left[P_{qq}(\xi) \ln \frac{4p_z^2}{\mu^2} + \xi - 1 \right]_{+(1)}^{[0,1]} + \left\{ P_{qq}(\xi) \left[\text{sgn}(\xi) \ln |\xi| + \text{sgn}(1-\xi) \ln |1-\xi| \right] \right.$$

$$+ \text{sgn}(\xi) + \left. \frac{3\xi - 1}{\xi - 1} \frac{\tan^{-1} \left(\sqrt{1-2\xi}/|\xi| \right)}{\sqrt{1-2\xi}} - \frac{3}{2|1-\xi|} \right\}_{+(1)}^{(-\infty, \infty)}$$

► Collinear divergences are identical between CG qPDF and light-cone PDF.

► Satisfies particle number conservation.

Short-distance factorization

$$\tilde{h}(z, P_z, \mu) = \int_{-1}^1 d\alpha \mathcal{C}(\alpha, \mu^2 z^2) \int_{-1}^1 dy e^{-iy\lambda} q(y, \mu) + \mathcal{O}(z^2 \Lambda_{\text{QCD}}^2)$$

- A. V. Radyushkin et al., PRD 96 (2017).

- **One-loop matching:**

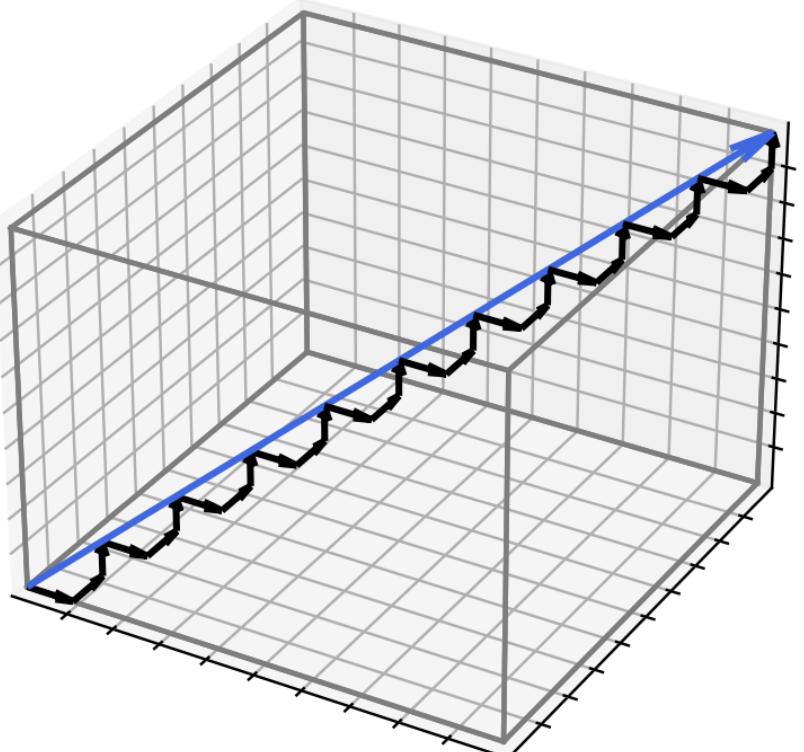

$$\mathcal{C}\left(u, \frac{\mu}{p^z}\right) = \delta(u - 1) + \frac{\alpha_s C_F}{2\pi} \mathcal{C}^{(1)}\left(u, \frac{\mu}{p^z}\right) + \mathcal{O}(\alpha_s^2)$$

$$\mathcal{C}^{(1)}(u, z^2 \mu^2) = \mathcal{C}_{\text{ratio}}^{(1)}(u, z^2 \mu^2) + \frac{1}{2} \delta(1 - u) \left(1 - \ln \frac{z^2 \mu^2 e^{2\gamma_E}}{4} \right)$$

$$\begin{aligned} \mathcal{C}_{\text{ratio}}^{(1)}(u, z^2 \mu^2) &= \left[-P_{qq}(u) \ln \frac{z^2 \mu^2 e^{2\gamma_E}}{4} - \frac{4 \ln(1 - u)}{1 - u} + 1 - u \right]_{+(1)}^{[0,1]} \\ &\quad + \left[\frac{3u - 1}{u - 1} \frac{\tan^{-1} \left(\frac{\sqrt{1-2u}}{|u|} \right)}{\sqrt{1 - 2u}} - \frac{3}{|1 - u|} \right]_{+(1)}^{(-\infty, \infty)} \end{aligned}$$

Lattice setup

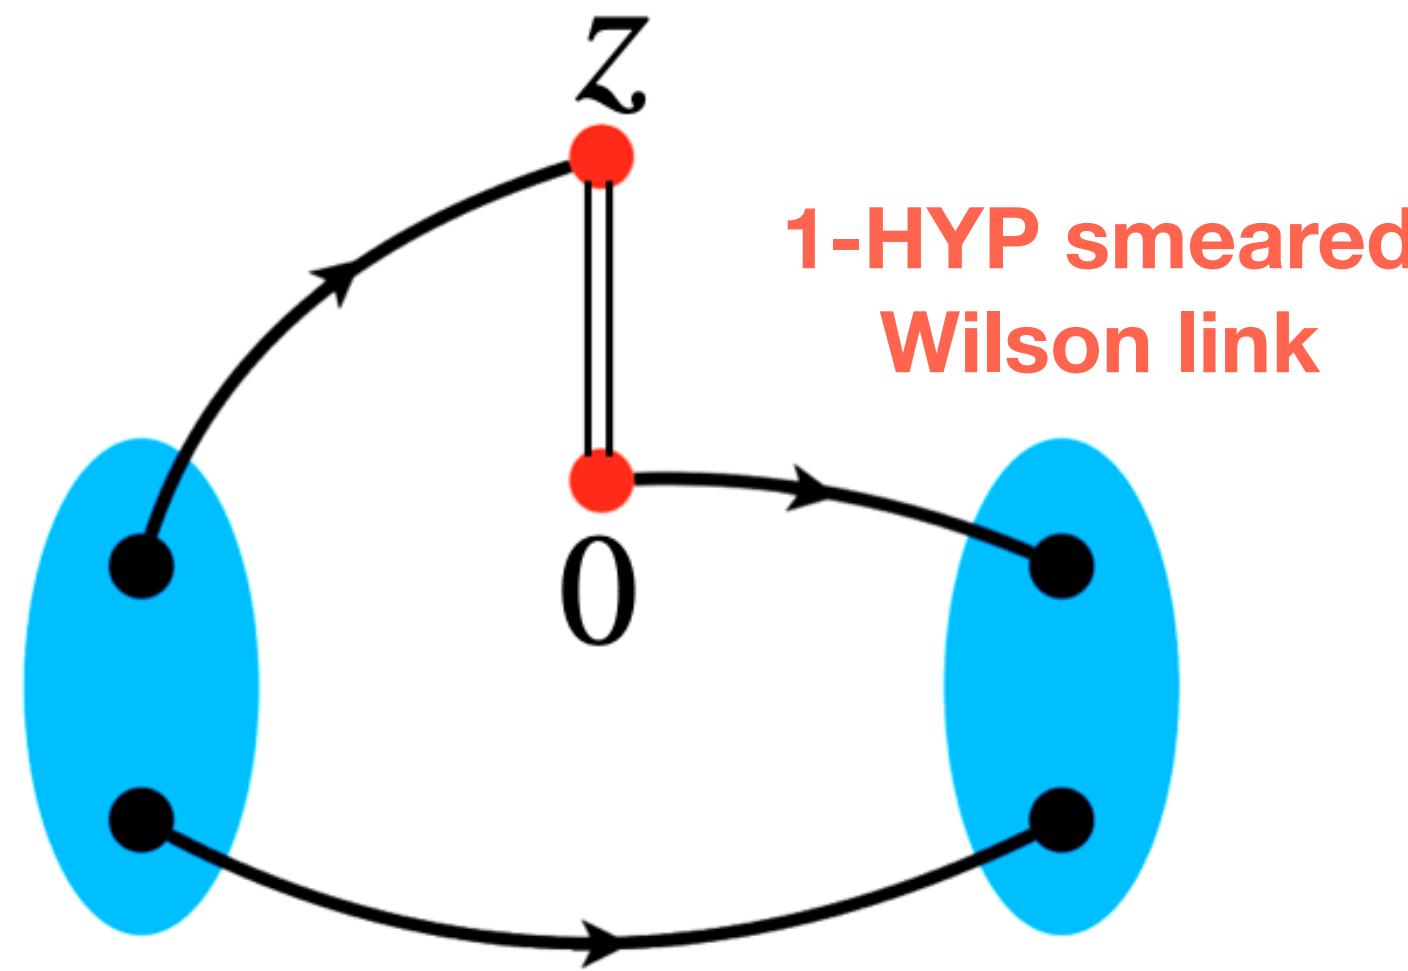

- Clover-fermion on 2+1f HISQ gauge ensembles, 1-step HYP smearing.
- $48^3 \times 64$, $a = 0.06$ fm, $m_\pi = 300$ MeV.
- Momentum $\vec{p} = \frac{2\pi}{L_s} \vec{n}$.
- 109 configurations & AMA.

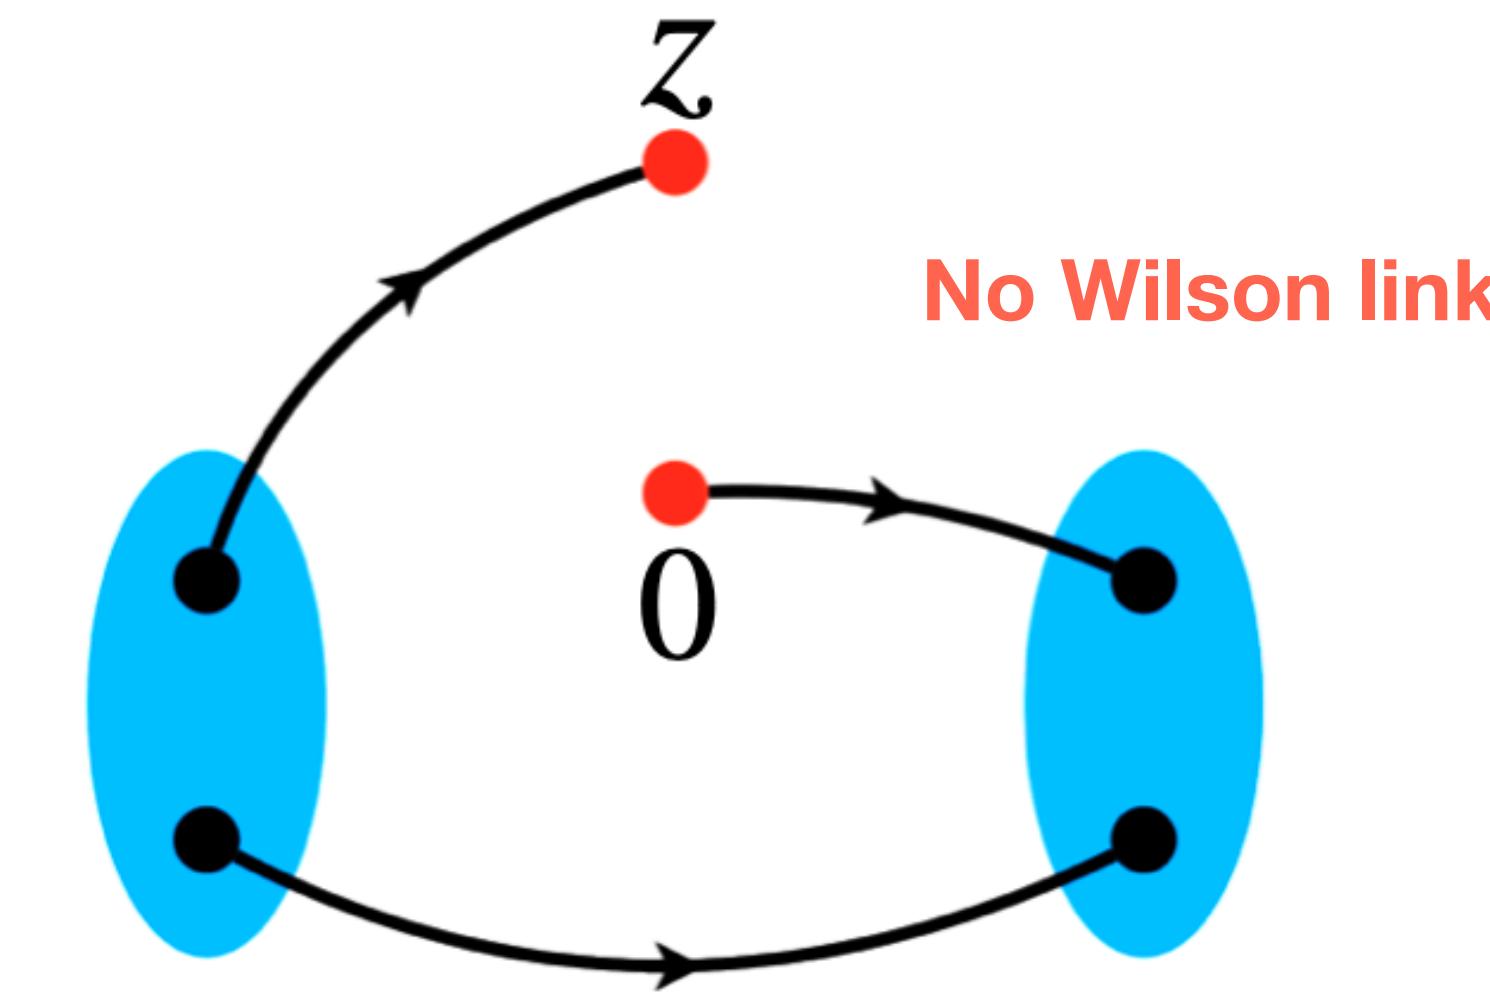

$ \vec{p} $ (GeV)	\vec{n}	\vec{k}	t_s/a	(#ex, #sl)
0	(0,0,0)	(0,0,0)	8,10,12	(1, 16)
1.72	(0,0,4)	(0,0,3)	8	(1, 32)
			10	(3, 96)
			12	(8, 256)
2.15	(0,0,5)	(0,0,3)	8	(2, 64)
			10	(8, 256)
			12	(8, 256)
2.24	(3,3,3)	(2,2,2)	8	(2, 64)
			10	(8, 256)
			12	(8, 256)

- In CG without Wilson line, the quark separation can be off-axis.

Lattice setup

Gauge invariant (GI)

Coulomb gauge (CG)

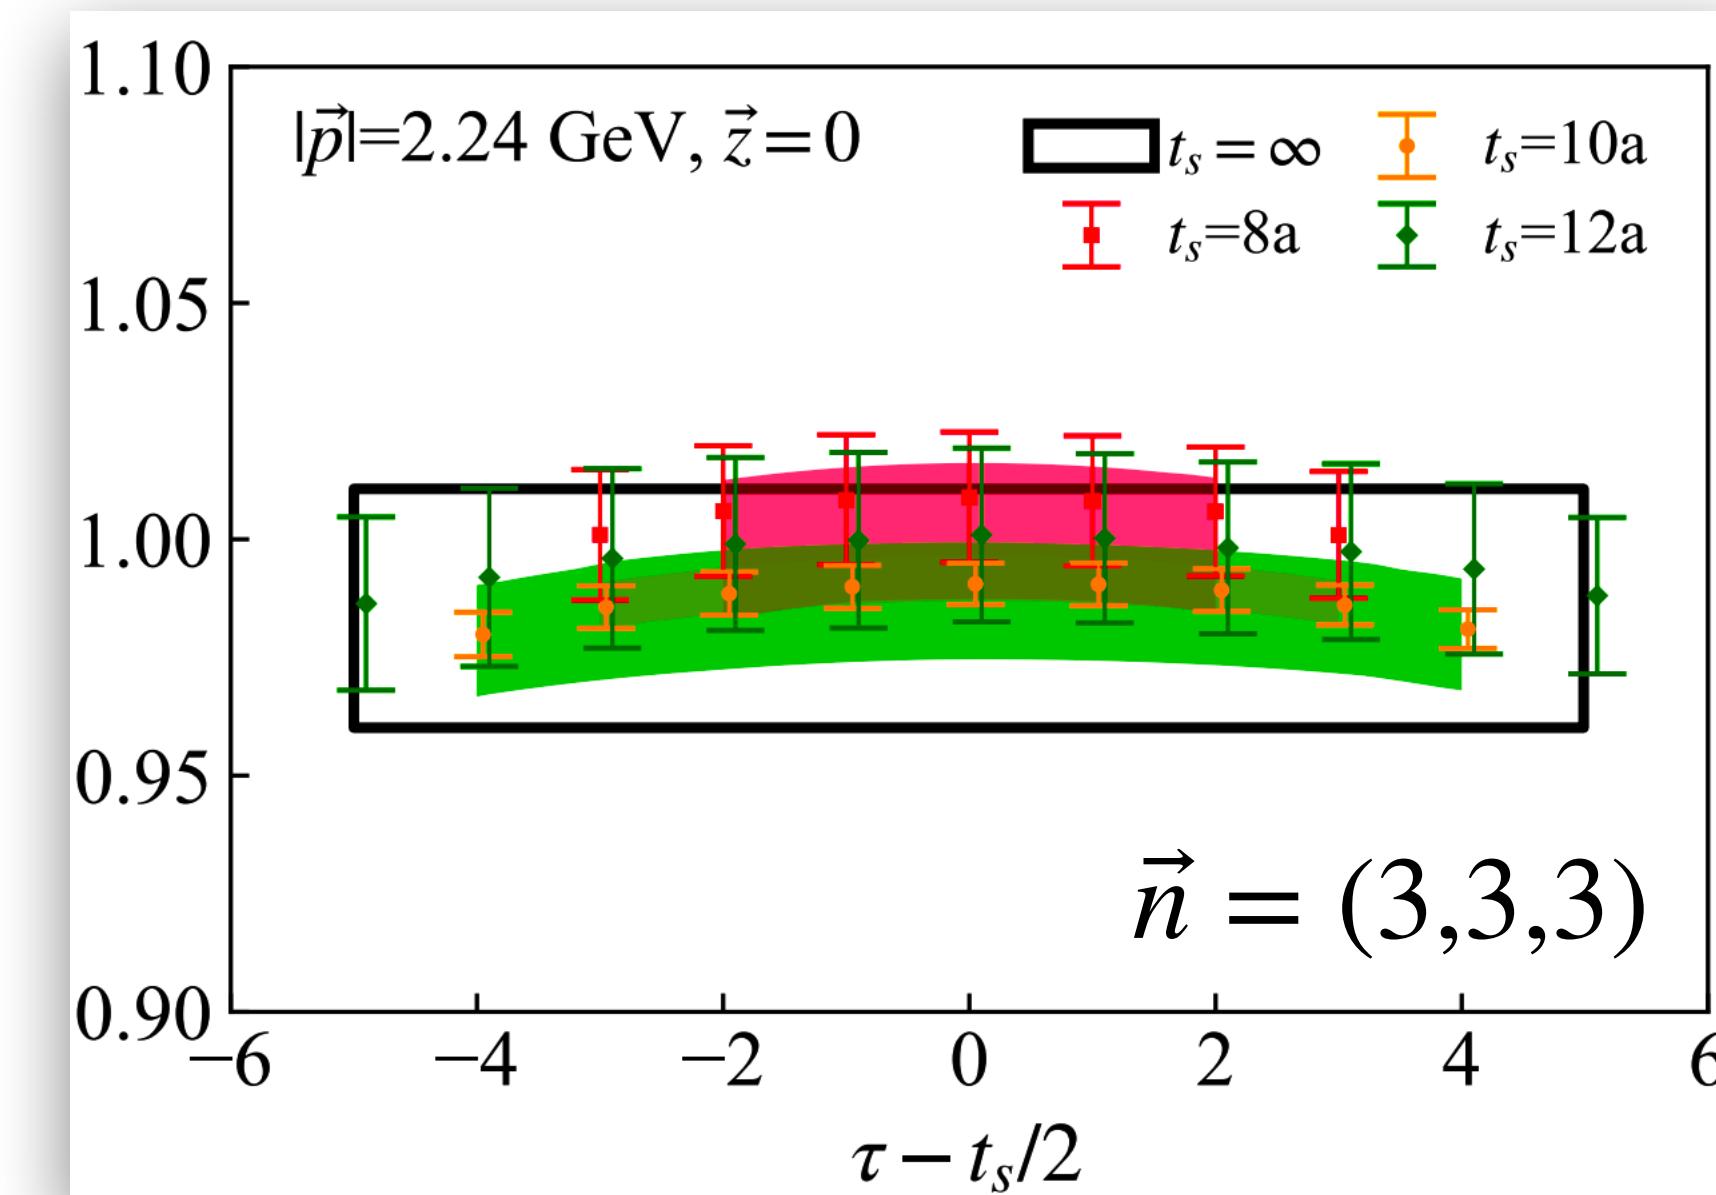

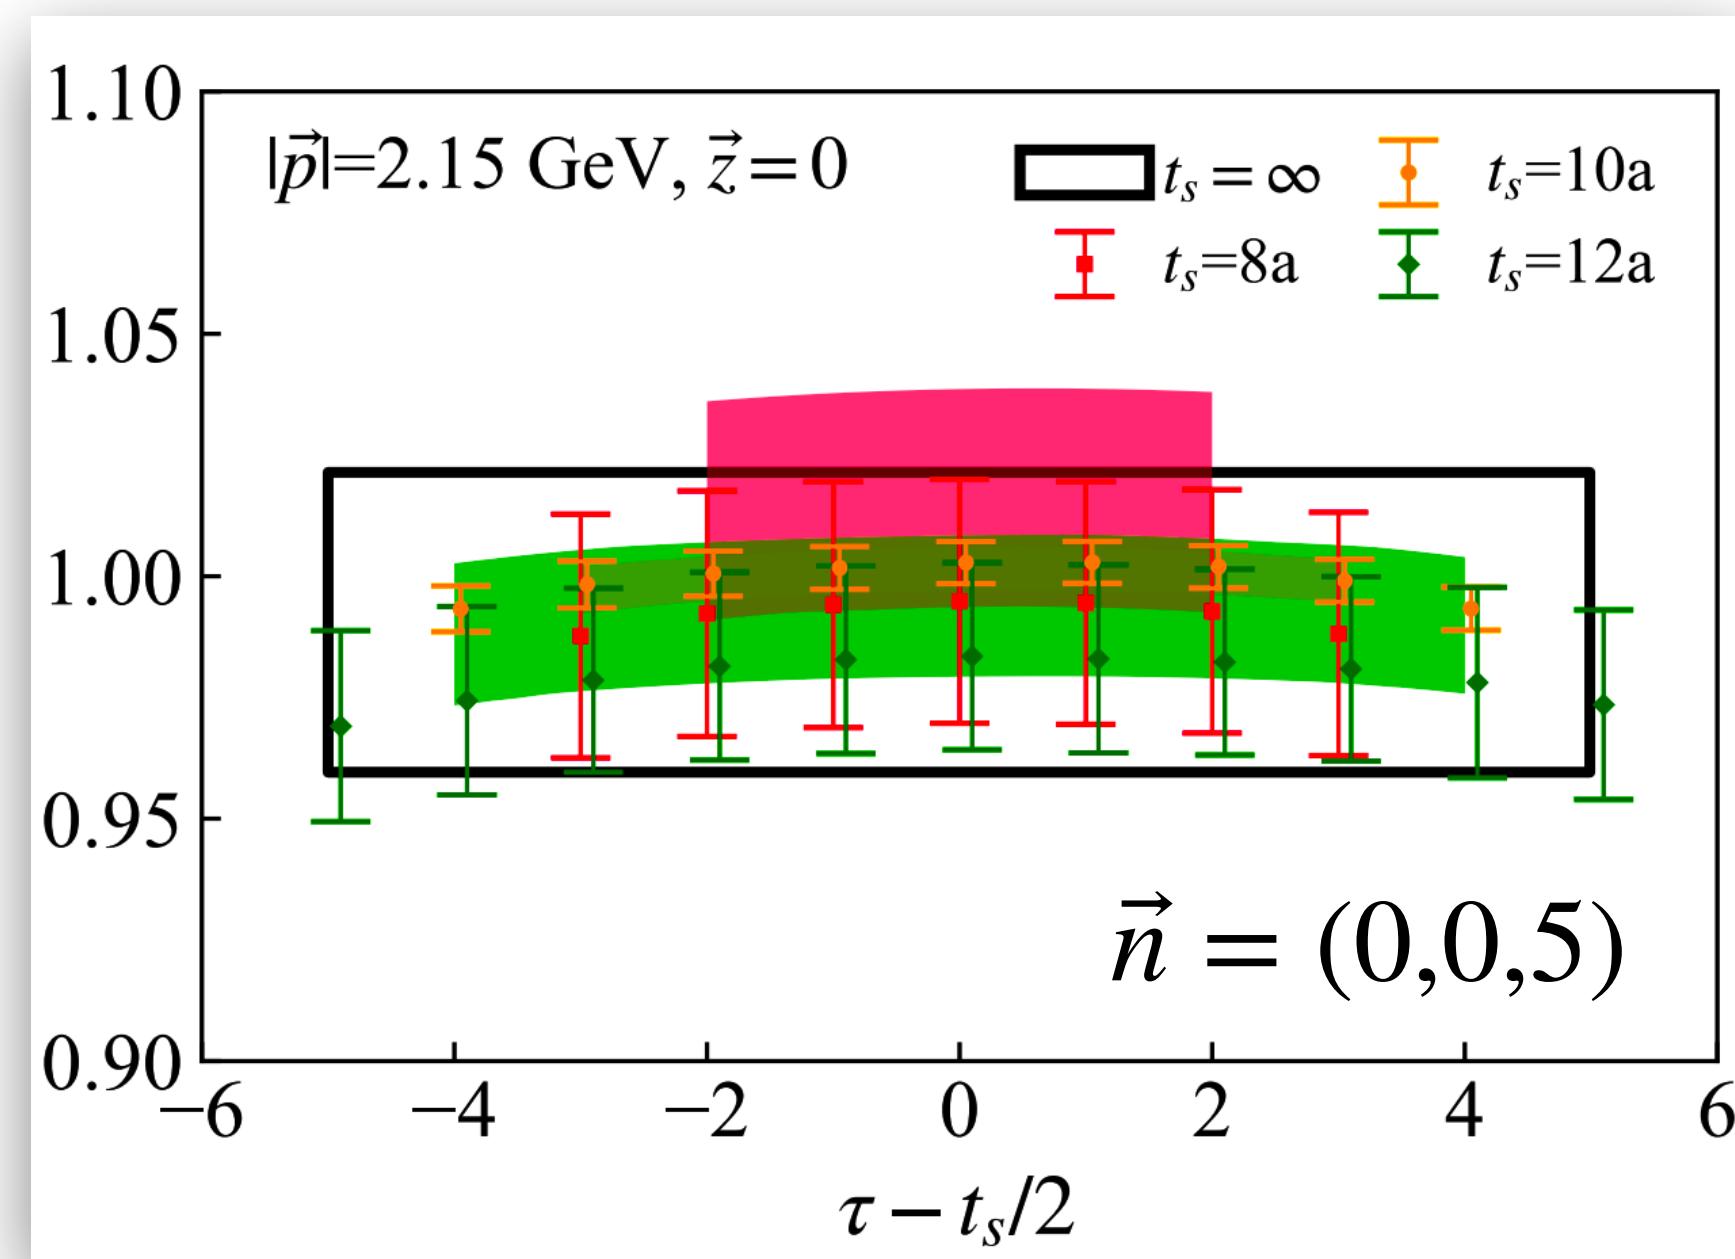

- The contraction of both GI and CG cases can be done simultaneously using the same propagators in Coulomb gauge.

Bare matrix elements: data precision

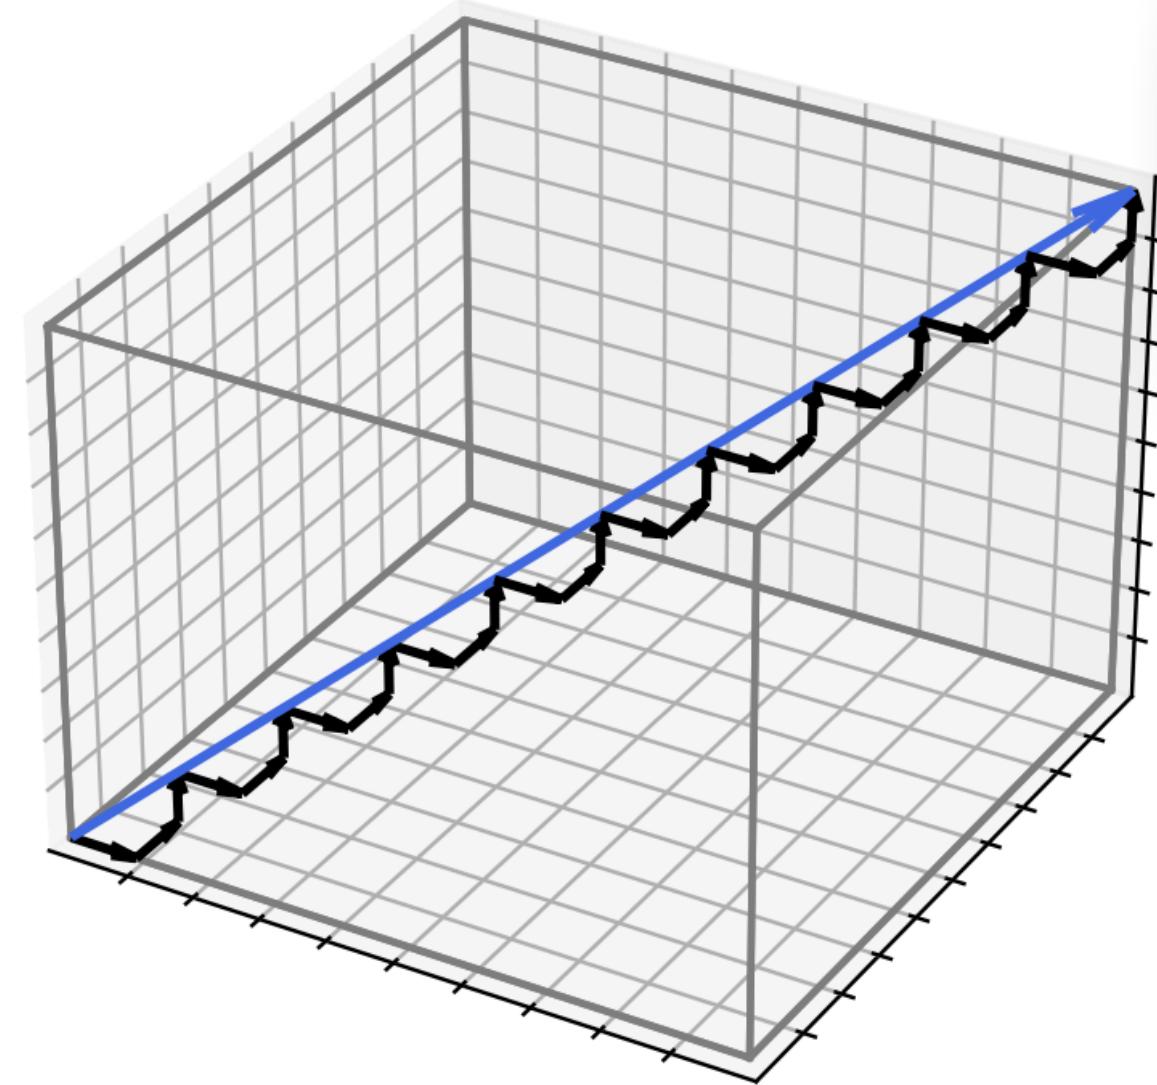

$$R(t_s, \tau) = \frac{\langle N(t_s) \mathcal{O}_\Gamma^f(\vec{z}, \tau) \bar{N}(0) \rangle}{\langle N(t_s) \bar{N}(0) \rangle}$$

$$\xrightarrow{t_s \rightarrow \infty} \tilde{h}^B(z, P_z)$$

- Off-axis momentum shows some signal improvement .

Bare matrix elements: Rotational symmetry

- CG
- GI: Zig-zag

• B. Musch et al., PRD 83 (2011).

- On-axis

$$\vec{n} = (0,0,n_3)$$

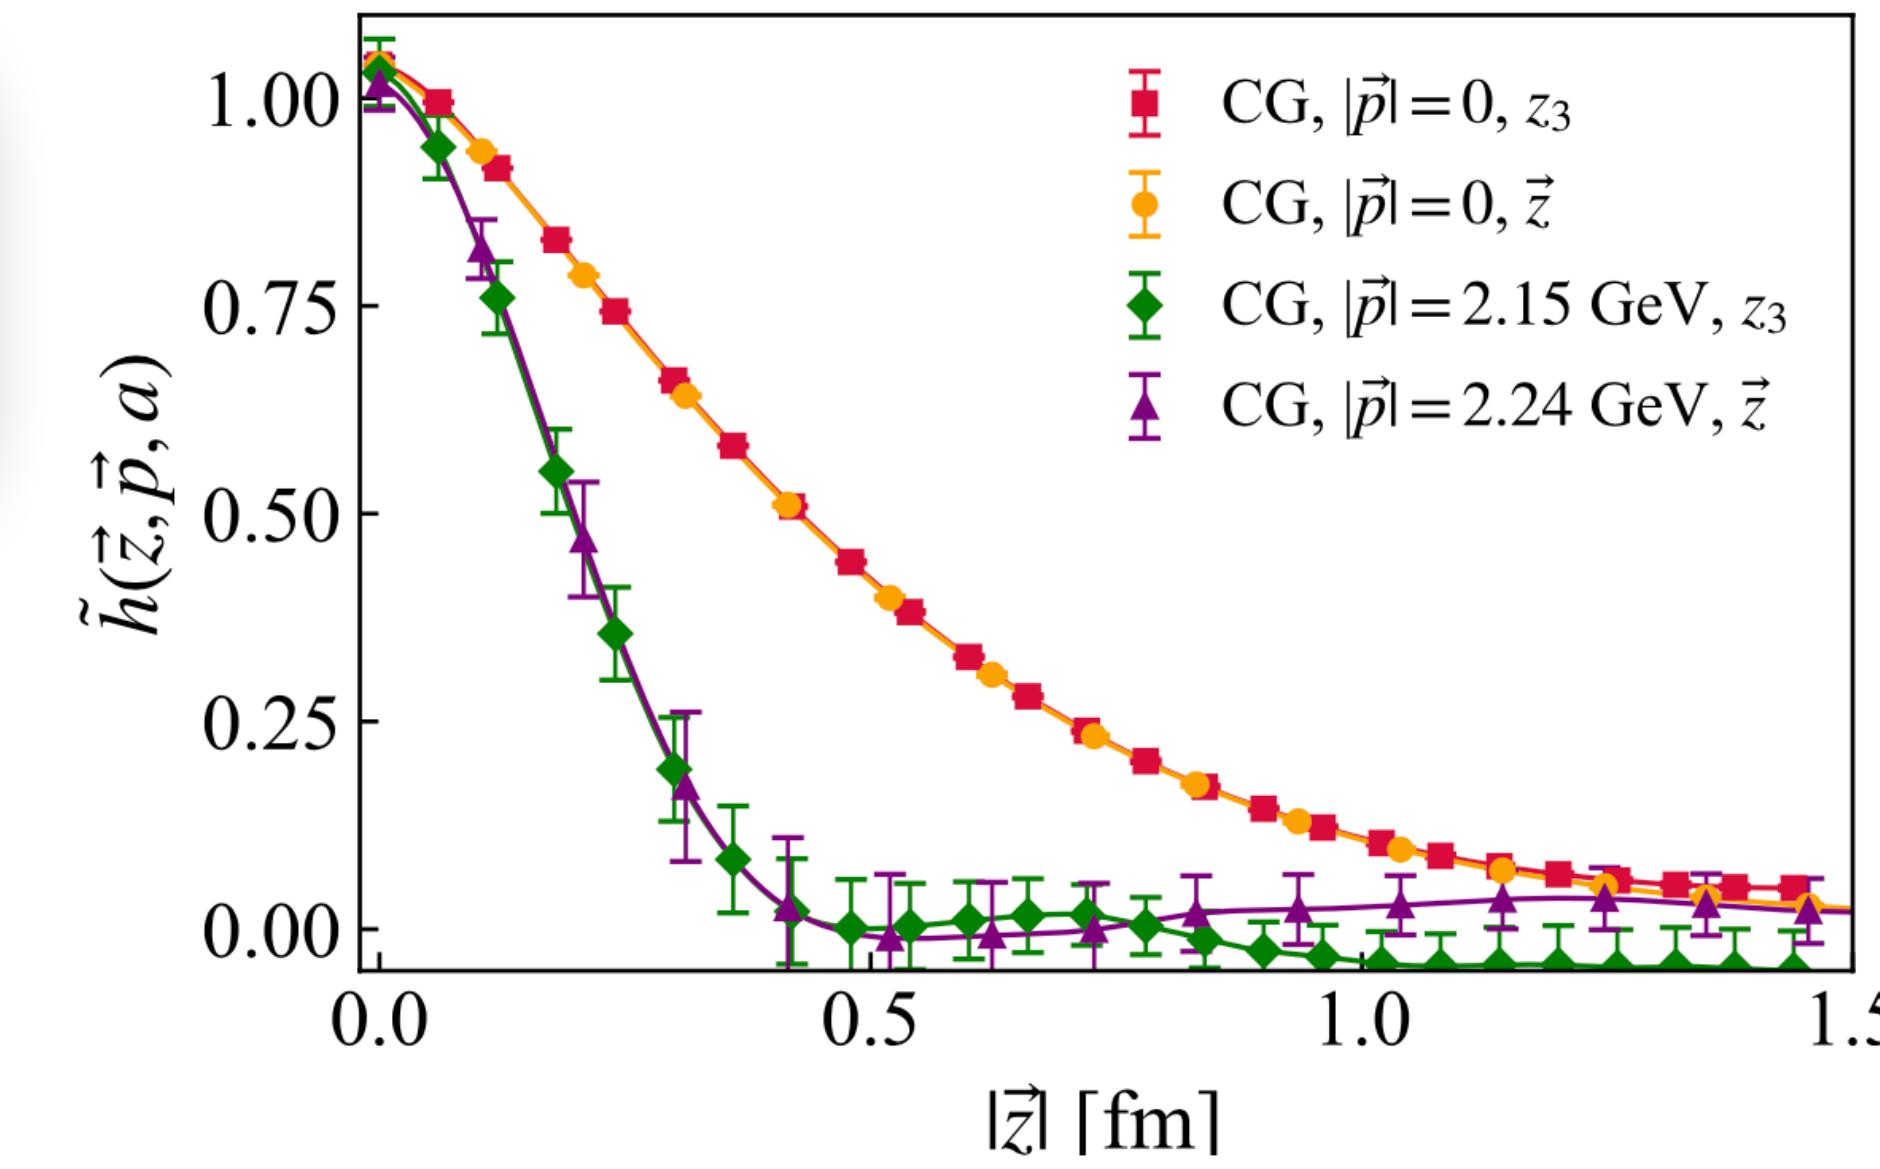

$$\vec{z} = (0,0,z_3)$$

- Off-axis

$$\vec{n} = (n_1, n_2, n_3)$$

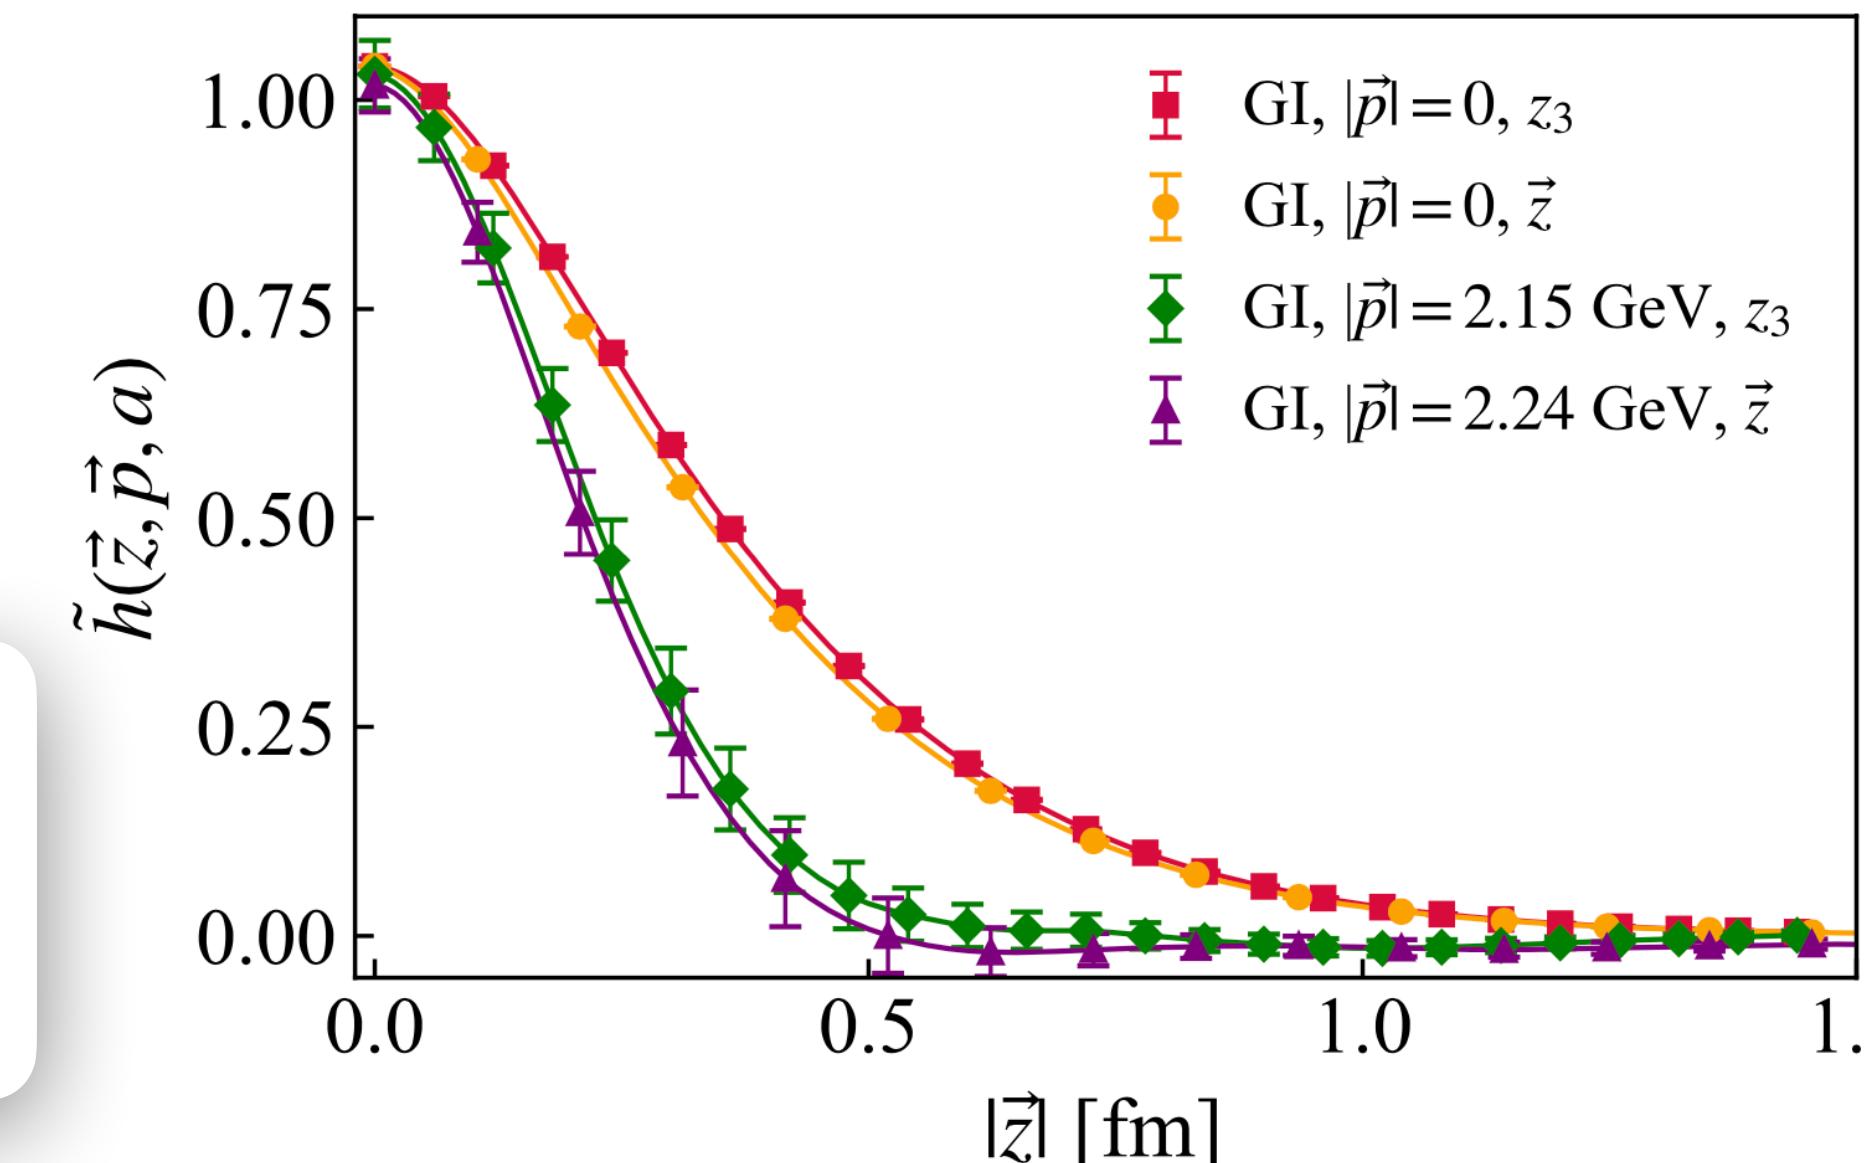

$$\vec{z} = (z_1, z_2, z_3)$$

► CG matrix elements precisely preserve the **3D rotational symmetry**, which is broken for GI with a zig-zagged Wilson line.

$$\vec{n} = (0,0,5)$$

$$\vec{n} = (3,3,3)$$

$$\vec{n} = (0,0,5)$$

$$\vec{n} = (3,3,3)$$

Bare matrix elements: Renormalizability

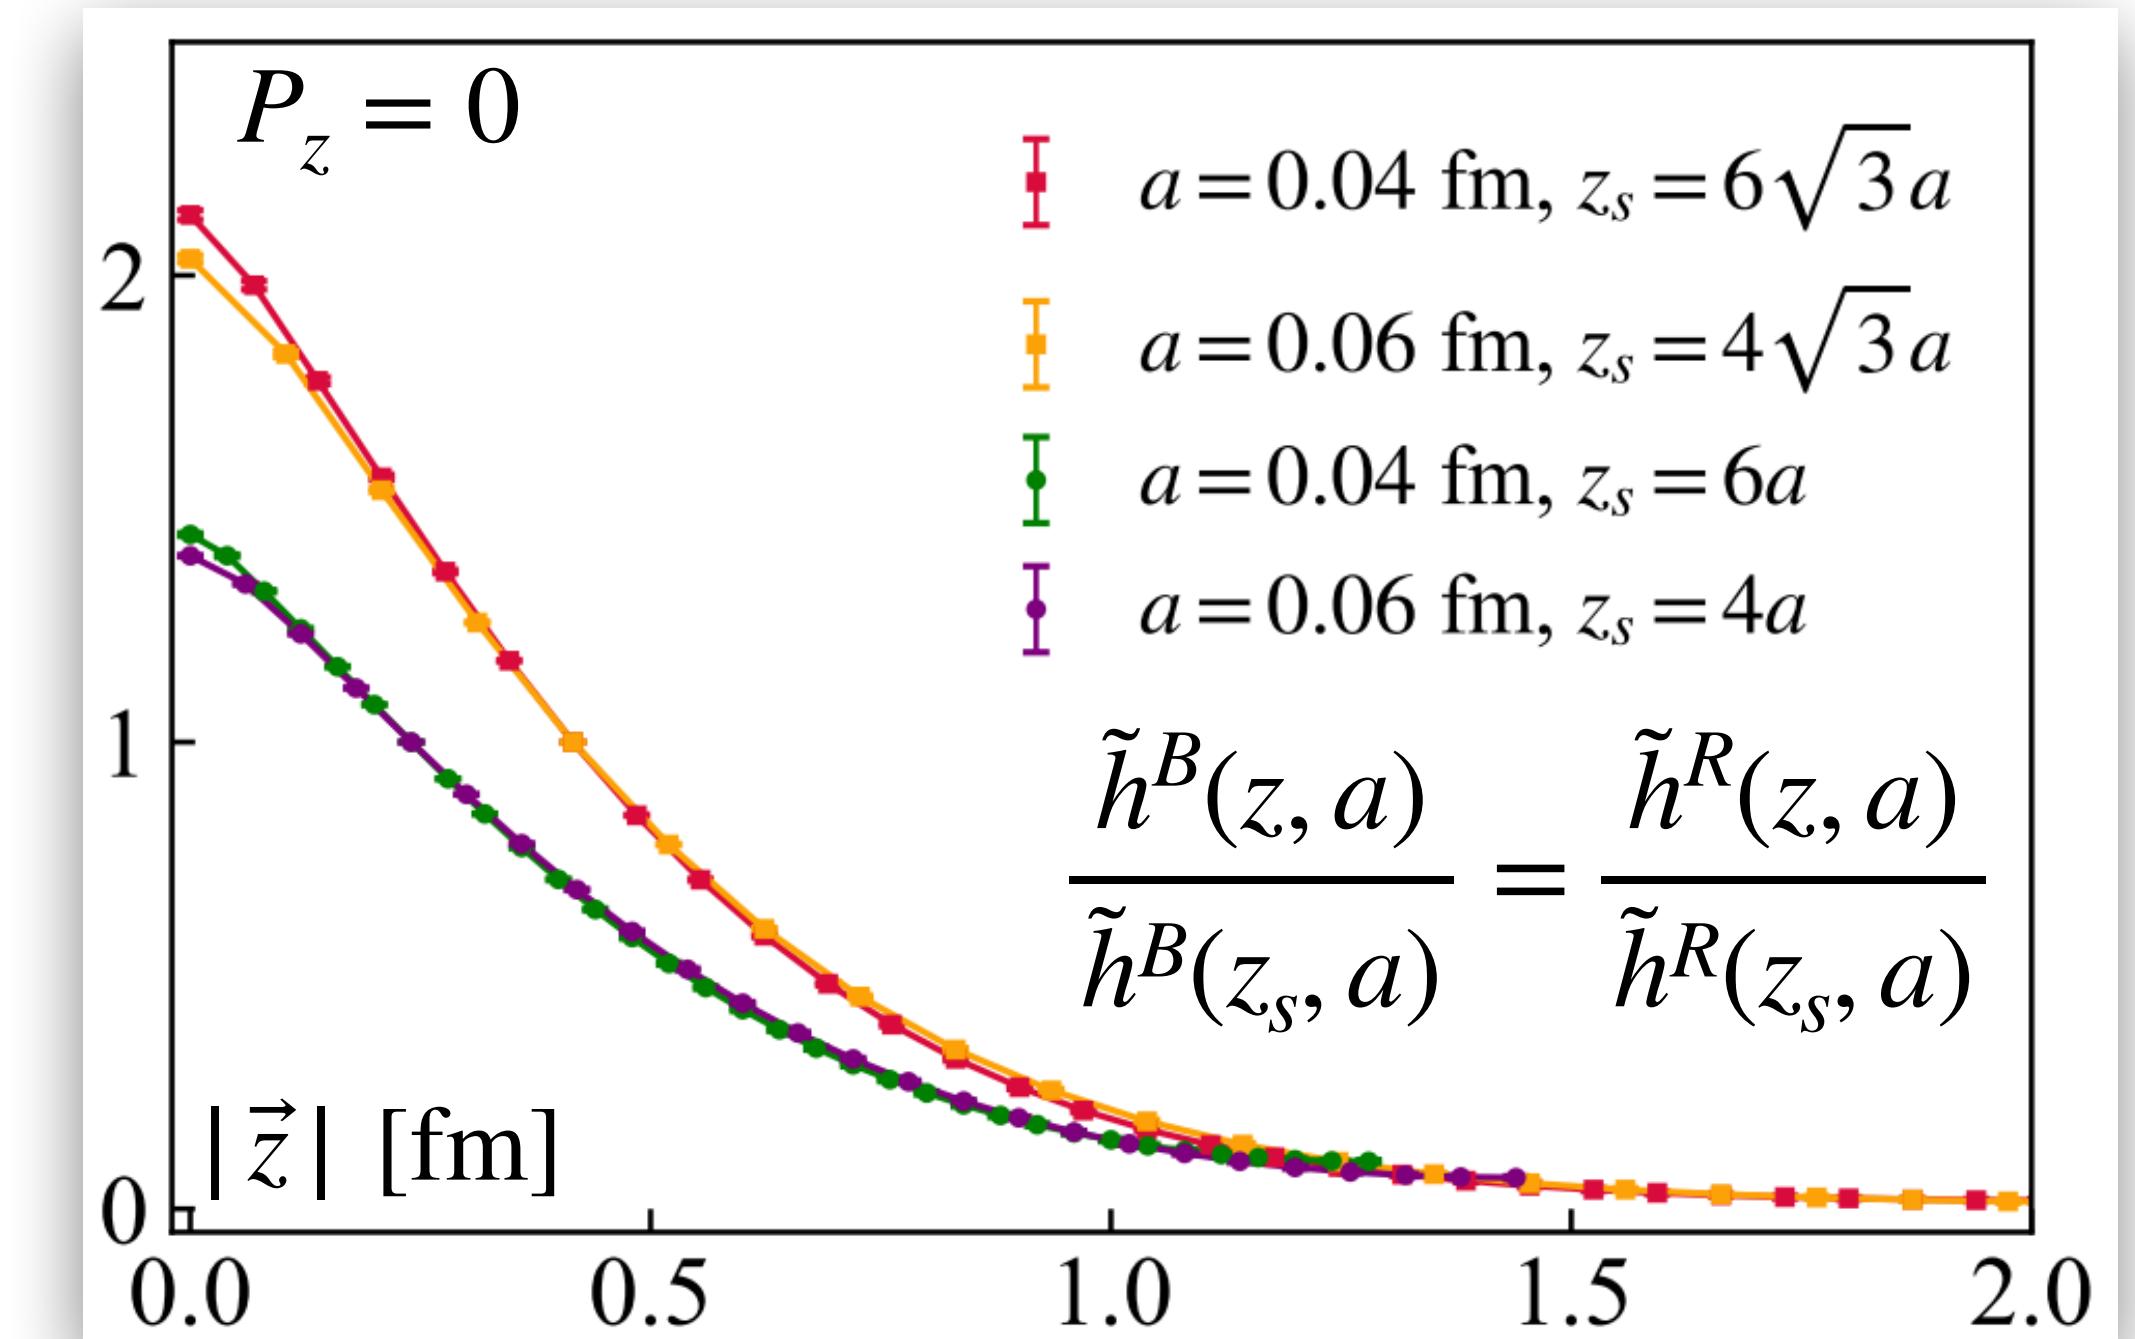

- The lattice quark propagator in Coulomb gauge are multiplicatively renormalizable.
- No Wilson-line and linear divergence renormalization needed.

- D. Zwanziger, NPB 518 (1998);
- Baulieu and Zwanziger, NPB 548 (1999);
- A. Niegawa, PRD 74 (2006);
- Niegawa, Inui and Kohyama, PRD 74 (2006)
- G. Burgio, et al., PRD 86 (2012)

Overall renormalization

$$[\bar{\psi}(0)\Gamma\psi(z)]_B = \underline{Z_\psi(a)} [\bar{\psi}(0)\Gamma\psi(z)]_R$$

$$\frac{\tilde{h}^B(z, a)}{\tilde{h}^B(z_s, a)} = \frac{\tilde{h}^R(z, a)}{\tilde{h}^R(z_s, a)}$$

Another lattice is used to check the renormalization:

$64^3 \times 64$, $a = 0.04$ fm, $m_\pi = 300$ MeV.

Excellent continuum limit!

Renormalized matrix elements in short distance

Ratio scheme renormalization:

$$\mathcal{M}(z, P^z, a) = \frac{\tilde{h}(z, P^z, a)}{\tilde{h}(z, 0, a)} \frac{\tilde{h}(0, 0, a)}{\tilde{h}(0, P^z, a)}$$

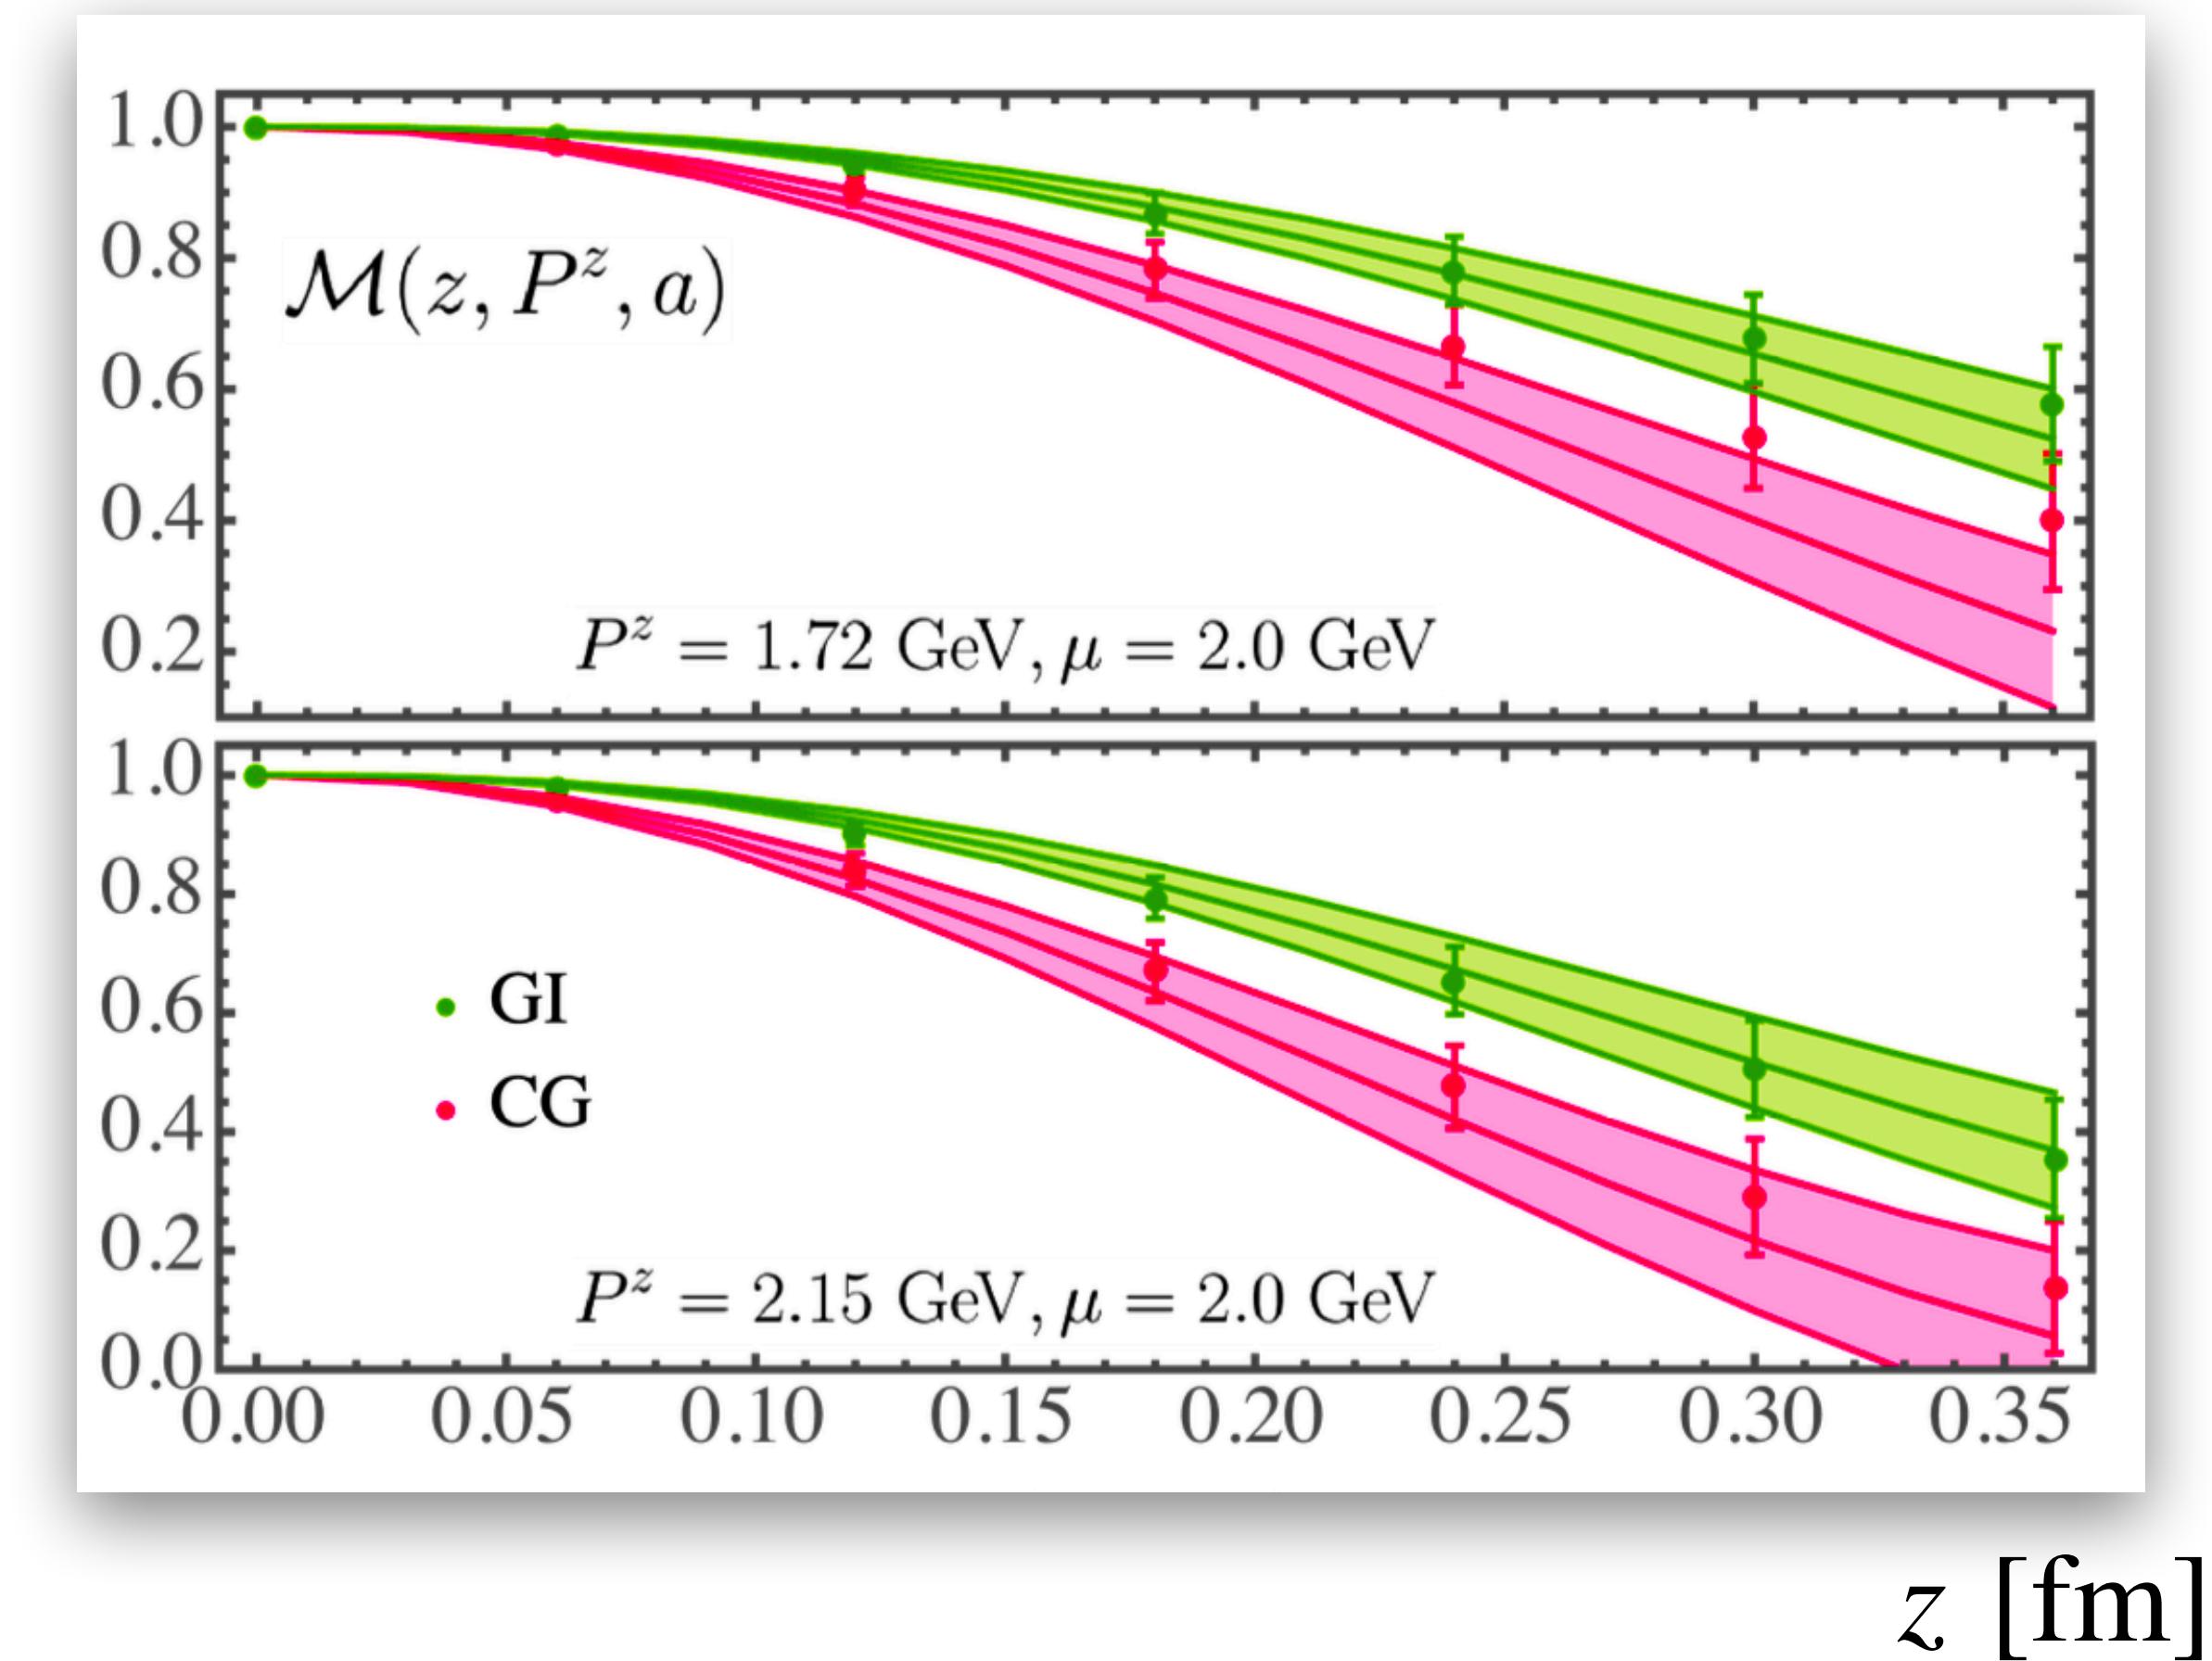

• K. Orginos et al., PRD 96 (2017).

- ▶ The prediction from GI agree well with the CG matrix elements:

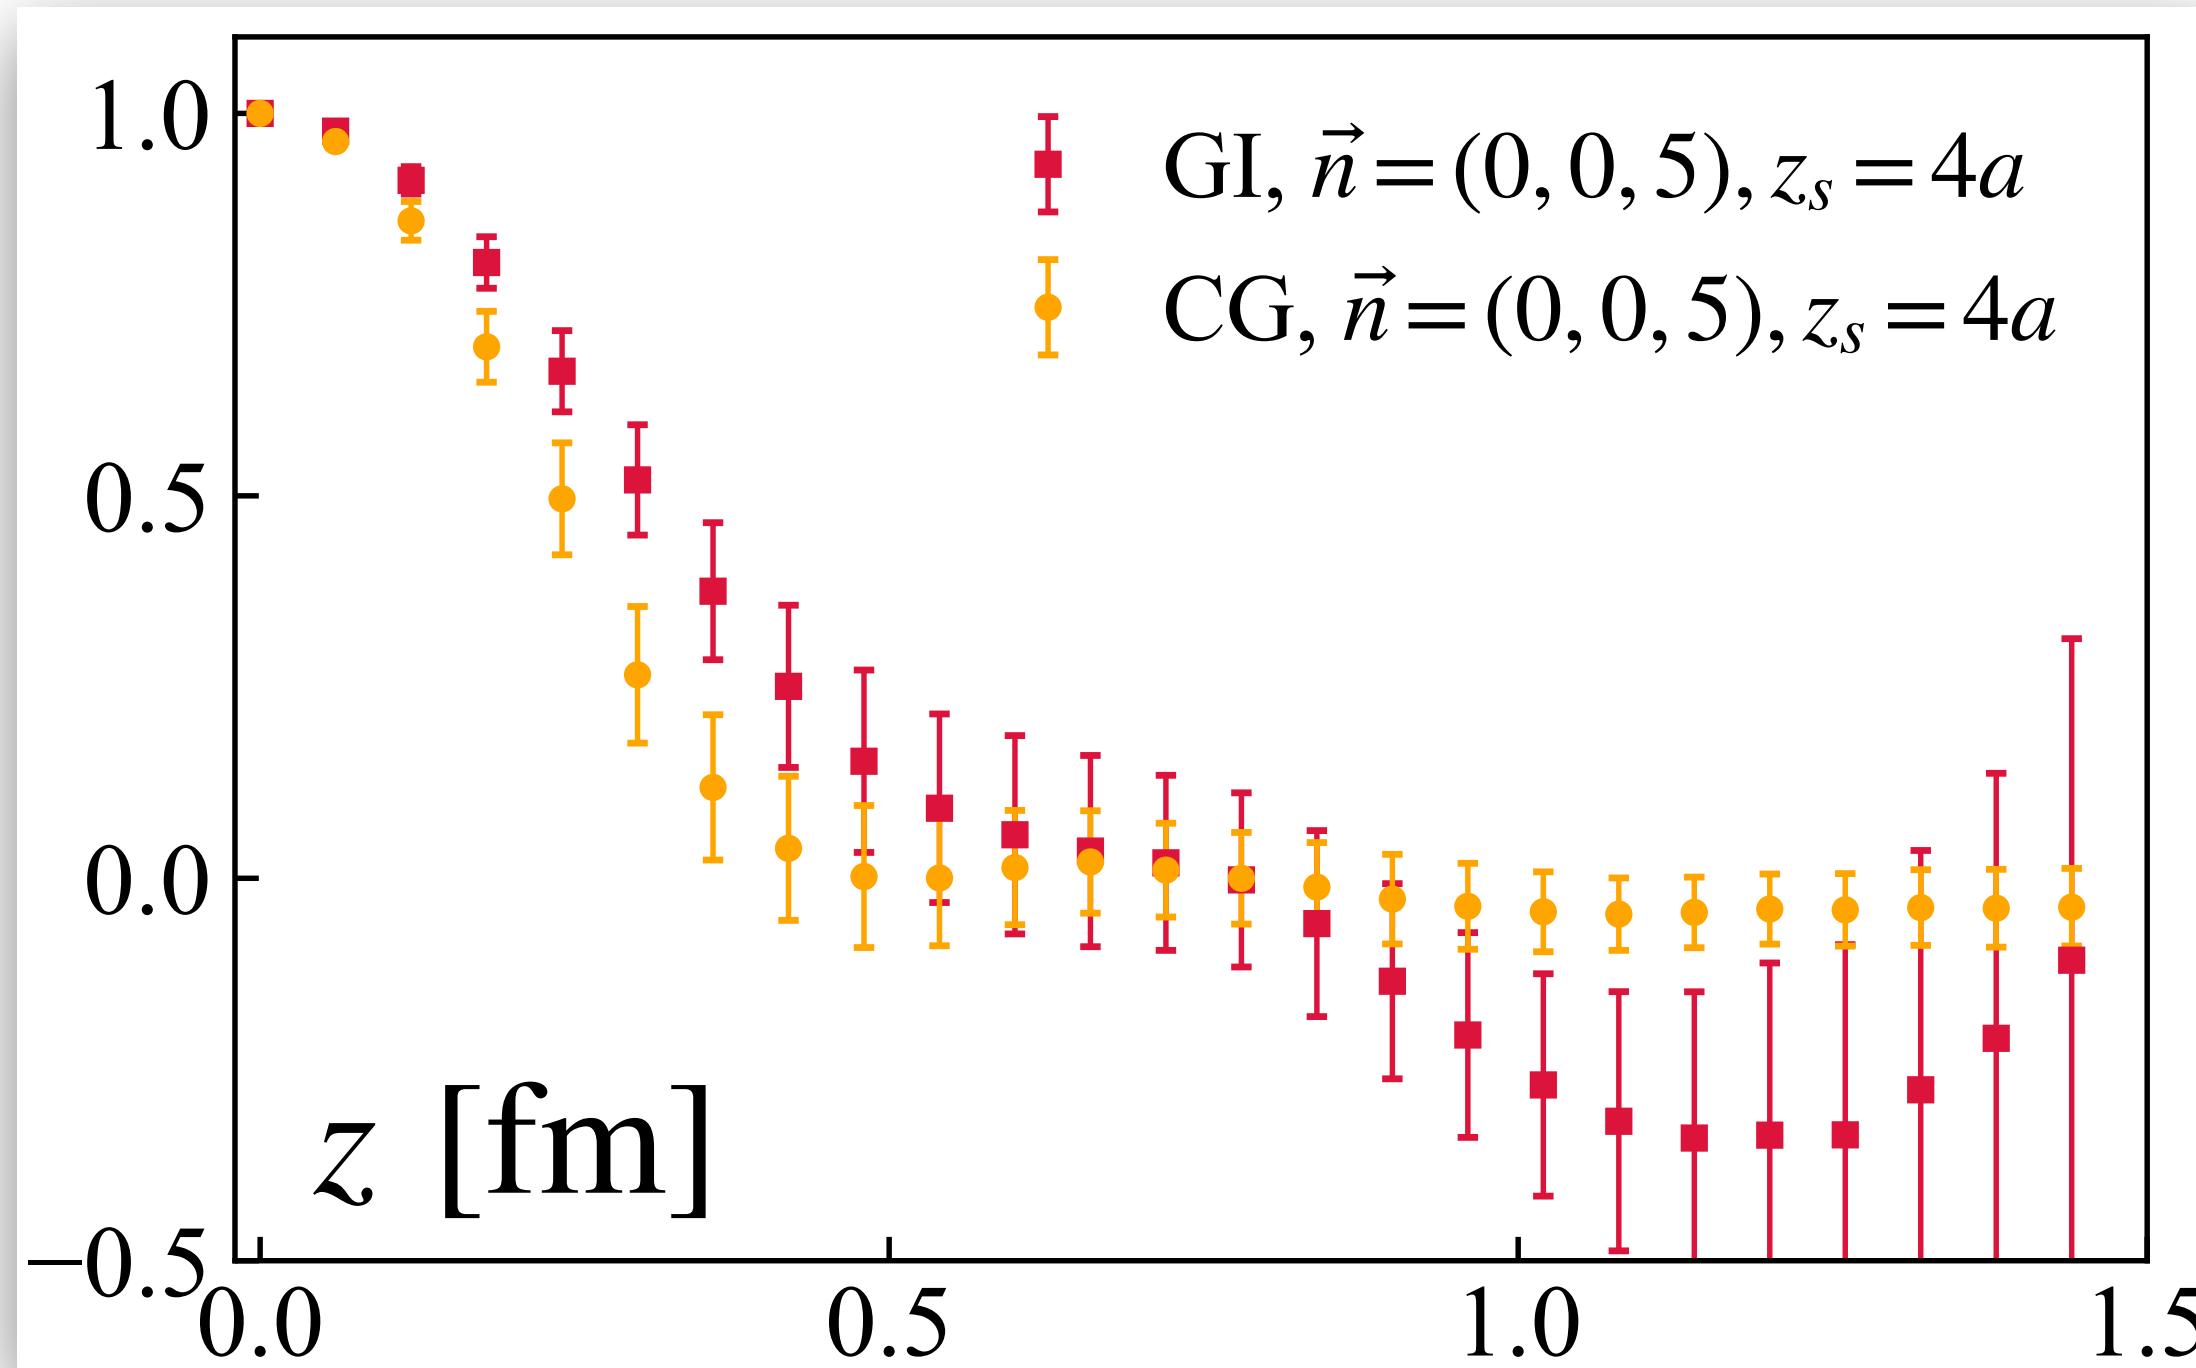

qPDF_{GI} → PDF → qPDF_{CG}

NLO

NLO

x -dependent PDF: hybrid renormalization

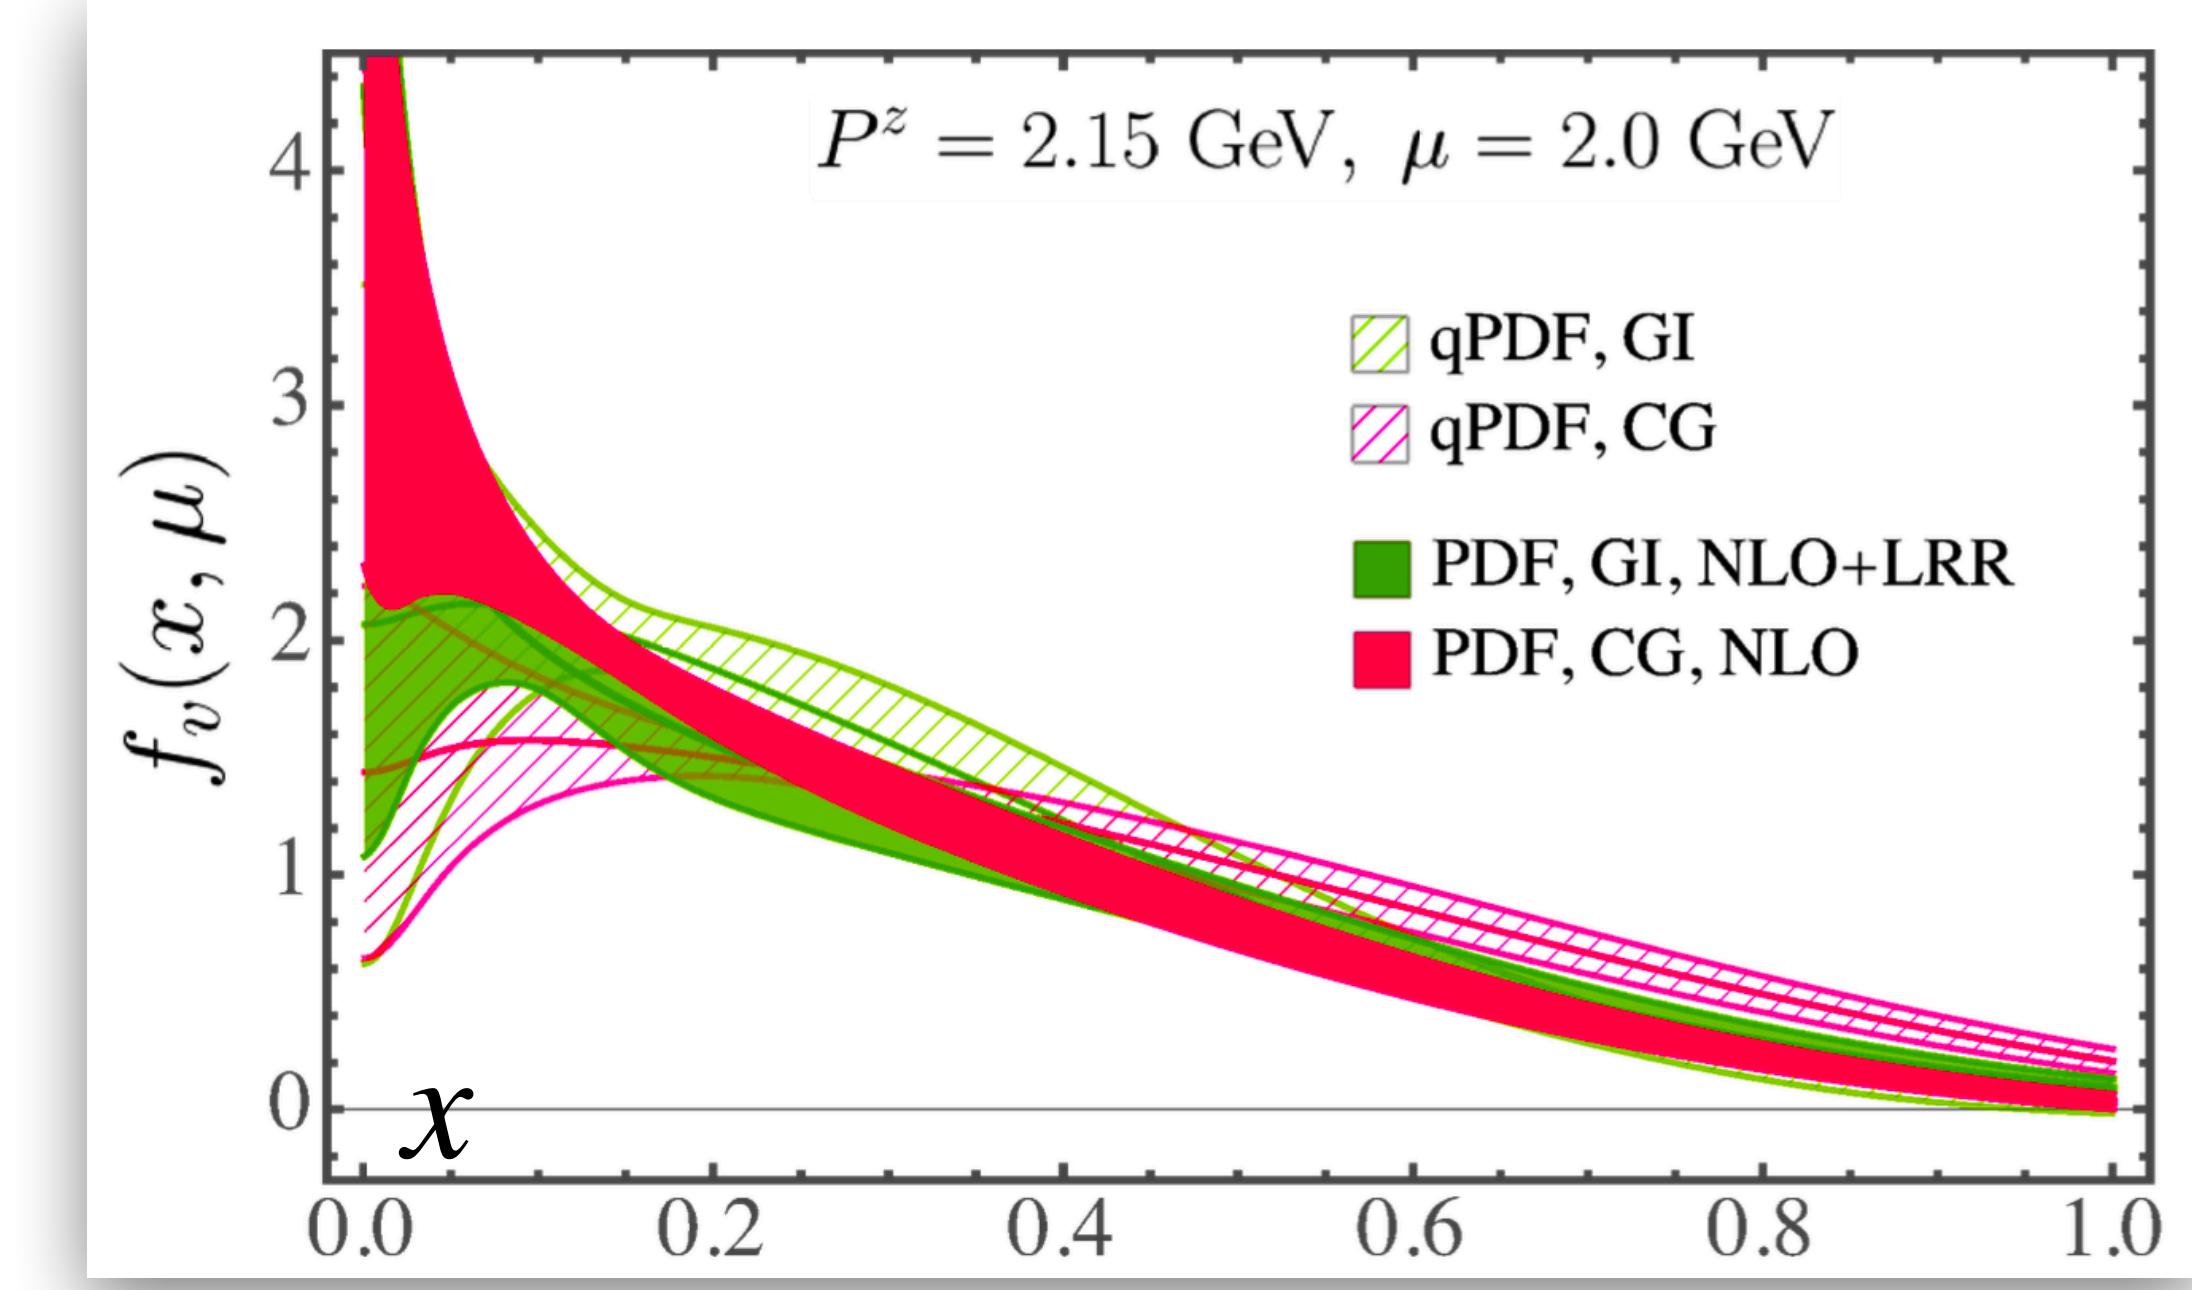

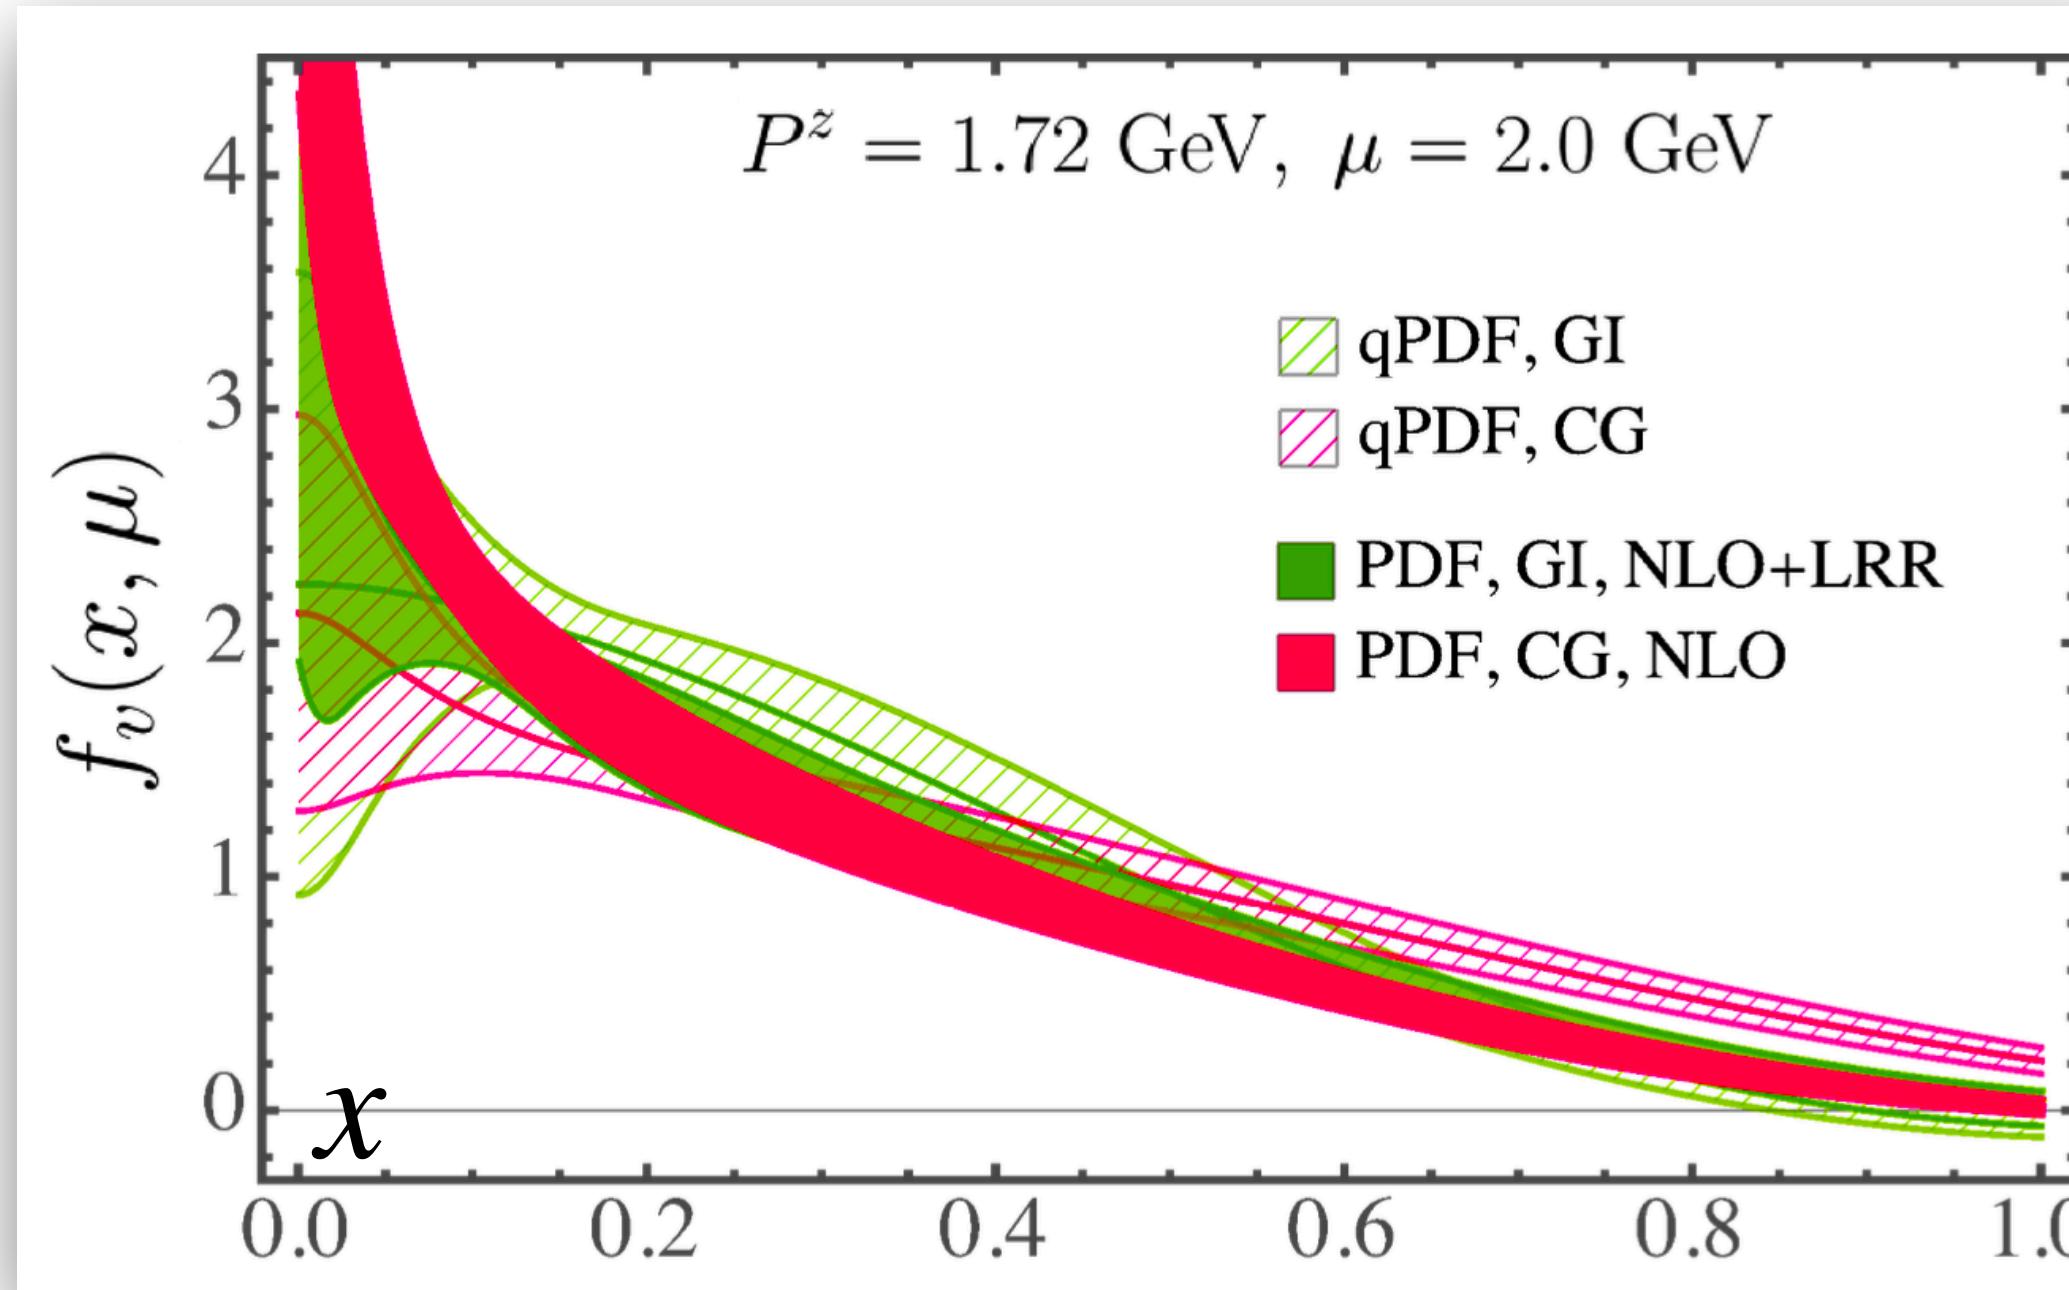

$$\begin{aligned} |z| \leq z_s, \quad & \frac{\tilde{h}(z, P_z, a)}{\tilde{h}(z, 0, a)} \\ |z| > z_s, \quad & \frac{\tilde{h}(z, P_z, a)}{\tilde{h}(z_s, 0, a)} e^{(\delta m(a) + \bar{m}_0)|z - z_s|} \end{aligned}$$

• X. Ji, et al., Nucl.Phys.B 964 (2021) 115311

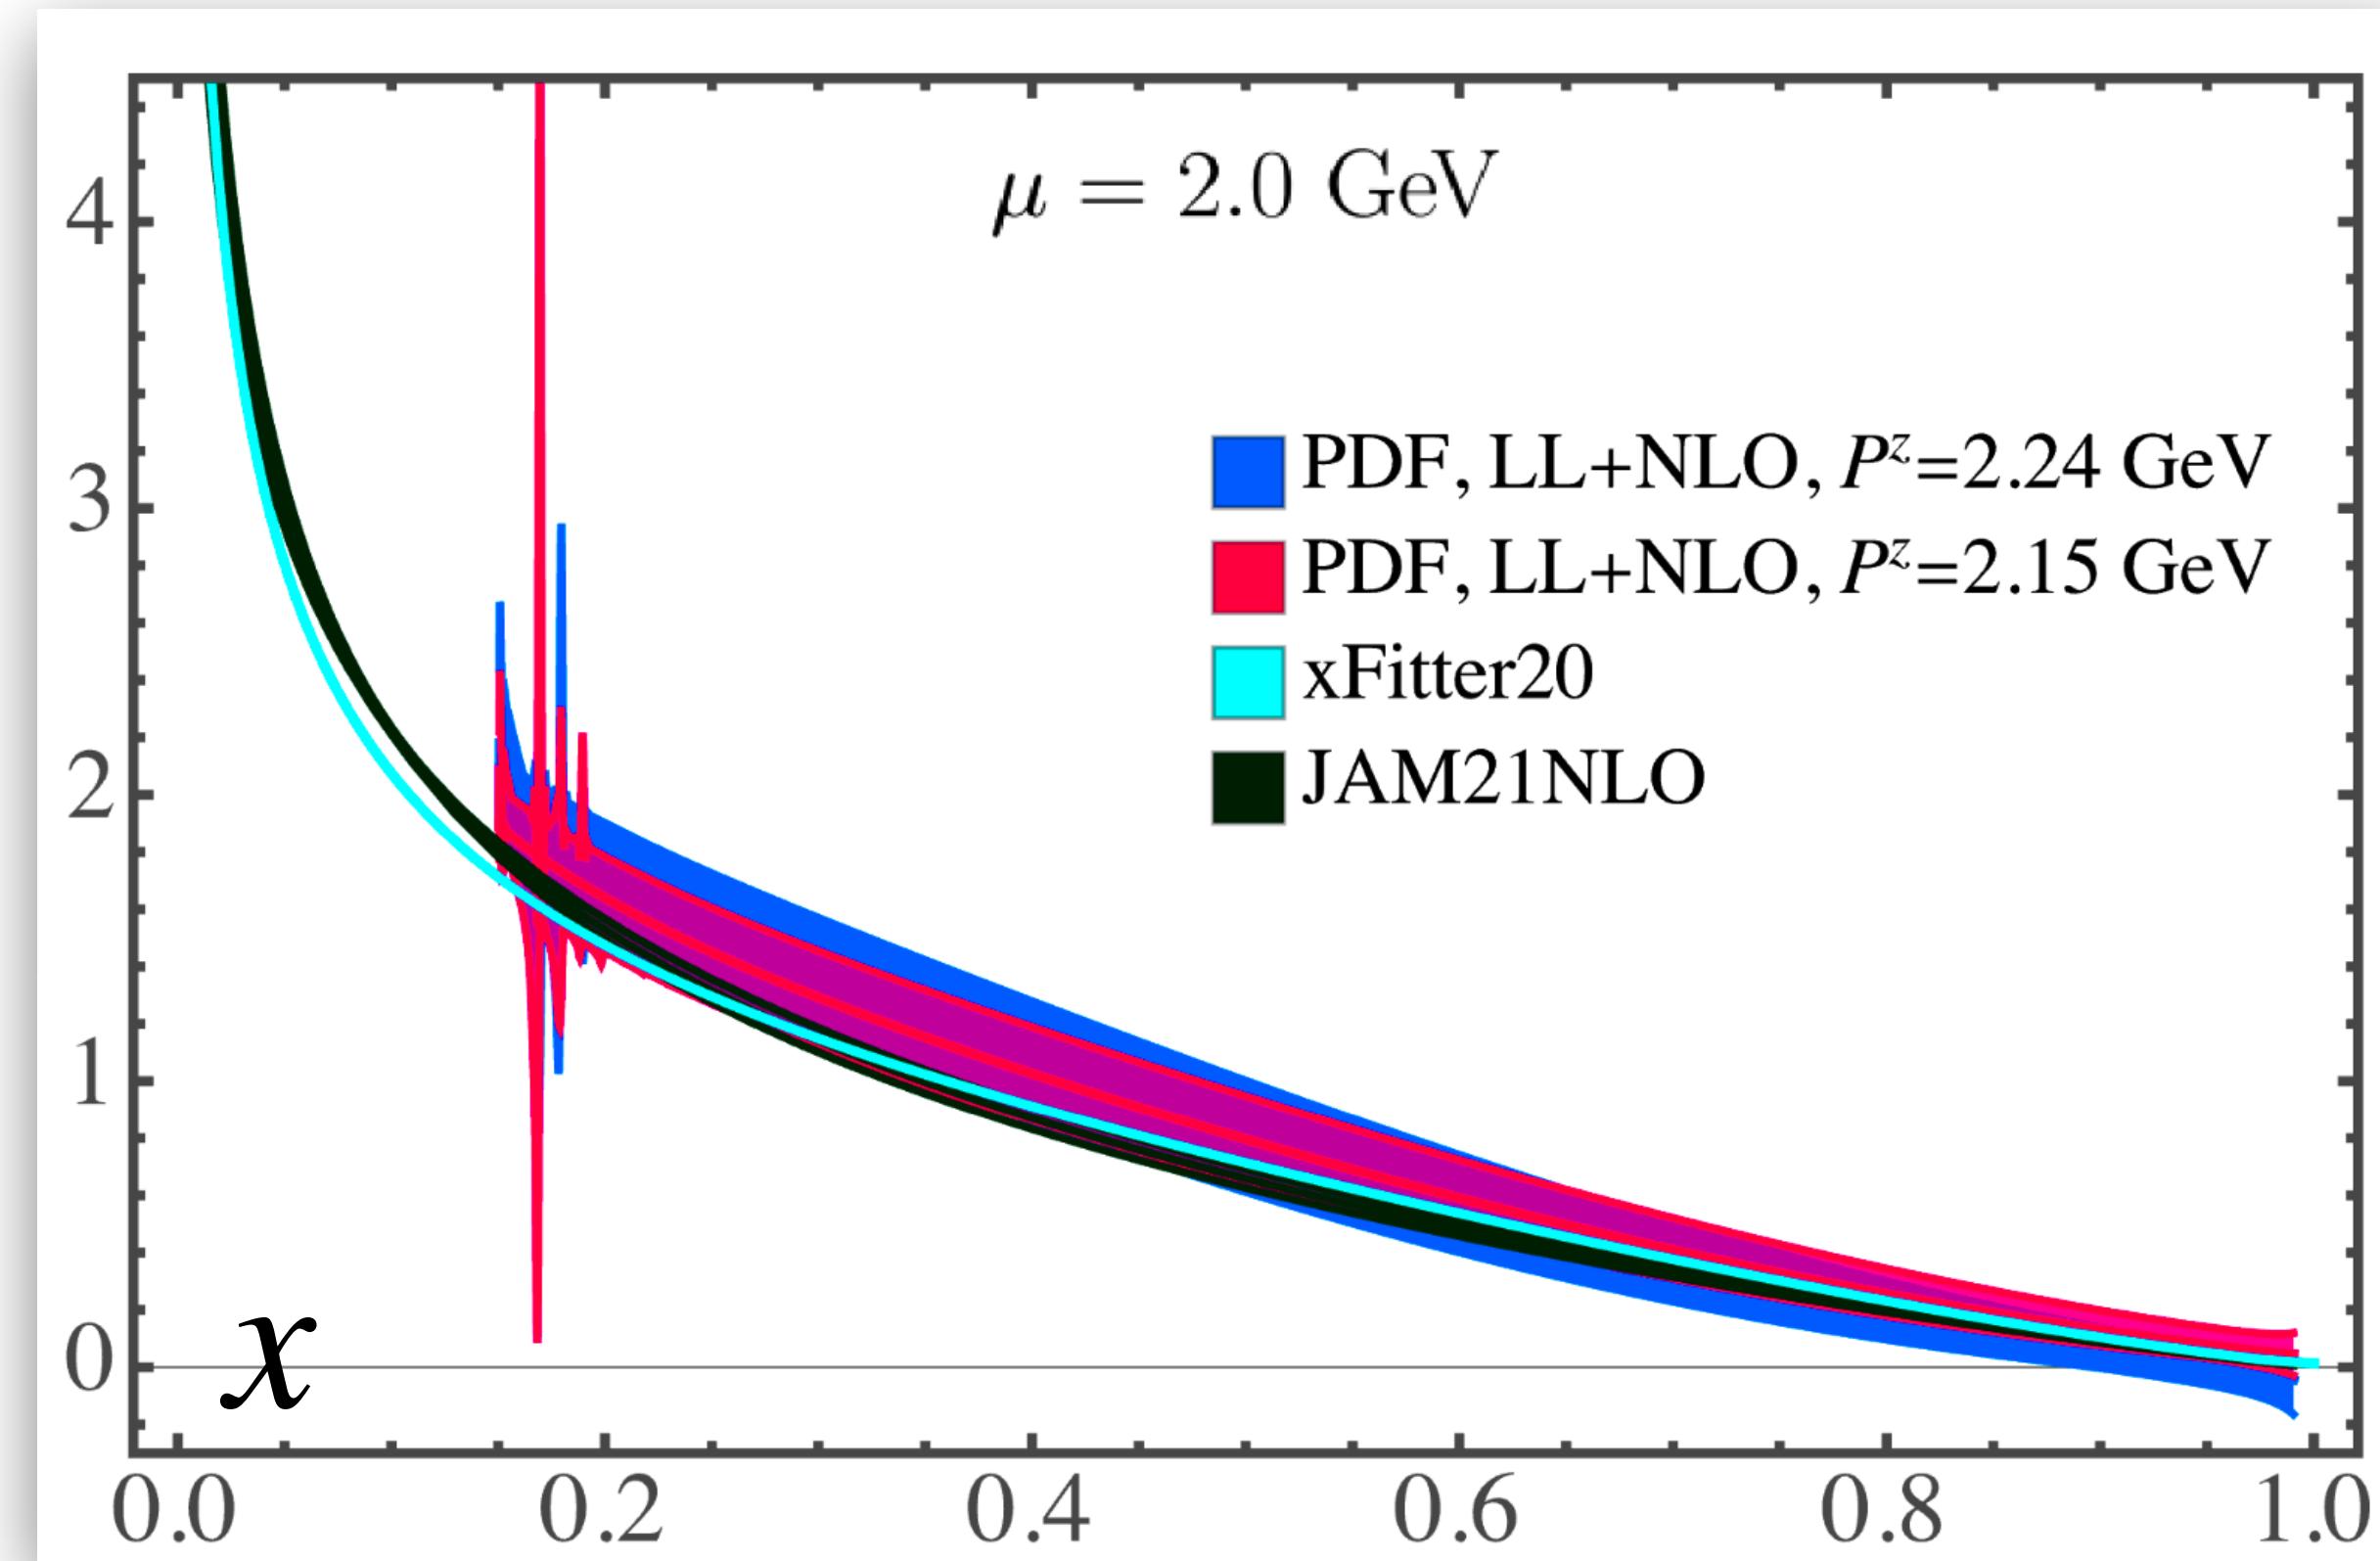

- ▶ No linear divergence and renormalon need to be removed in CG case.
- ▶ Better controlled long-range precision in CG case.

x -dependent PDF: F.T. and matching

- ▶ The quasi-PDF are different at finite momentum between CG and GI.
- ▶ The PDF after matching show good agreement beyond $x > 0.2$, demonstrating the universality in LaMET.

x -dependent PDF: CG results

- LL: leading logarithm
DGLAP resummation:

$$C(\xi, \frac{\mu}{P_z}) \sim \left(\frac{\alpha_s(2xP_z)}{\alpha_s(\mu)} \right)^{\frac{\gamma_n}{\beta_0}}$$

- ▶ Agree with global fits from JAM and xFitter for $x \gtrsim 0.2$ within the errors.
- ▶ Precision can be considerably improved with more statistics in the future.

Comparison between GI and CG quasi-PDFs

	Momentum direction	Renormalization	Power corrections	Gribov copies	Mixing	Higher-order corrections
Gauge invariant (GI)	$(0, 0, n_z)$	Linear divergence + vertex and wave function	$\Lambda_{\text{QCD}}^2 / P_z^2$ w. renormalon subtraction	N/A	Lorentz symmetry	Available up to NNLO
Coulomb gauge (CG)	(n_x, n_y, n_z)	Wave function	$\Lambda_{\text{QCD}}^2 / \vec{p}^2$	May affect long range region*	3D rotational symmetry	May be harder to go beyond NLO

*: Currently negligible otherwise the errors will not reduce as the number of configuration increasing.

Summary

- We demonstrate the universality in LaMET through the equivalence of CG and GI quasi-PDF methods at NLO.
- The CG correlations have the advantages of access to larger off-axis momenta, absence of linear divergence, and enhanced long-range precision.
- It is almost free to compute the GI and CG matrix elements simultaneously.
- The CG methods could have broader use in the future particularly in the TMD physics, for which the Wilson-line geometry and renormalization can be significantly simplified.

Factorization of quasi-TMDs in CG

- Y. Zhao, arXiv: 2311.01391

Thanks for your attention!
