Inclusive lepton-hadron DIS – one hadron

□ Scattering amplitude:

$$M(\lambda, \lambda'; \sigma, q) = \overline{u}_{\lambda'}(k') \left[-ie\gamma_{\mu} \right] u_{\lambda}(k)$$

$$* \left(\frac{i}{q^{2}} \right) \left(-g^{\mu\mu'} \right)$$

$$* \langle X | eJ_{\mu'}^{em}(0) | p, \sigma \rangle$$

$$\overline{p, \sigma}$$

Cross section:

$$d\sigma^{\text{DIS}} = \frac{1}{2s} \left(\frac{1}{2}\right)^{2} \sum_{X} \sum_{\lambda,\lambda',\sigma} \left| M(\lambda,\lambda';\sigma,q) \right|^{2} \left[\prod_{i=1}^{X} \frac{d^{3}l_{i}}{(2\pi)^{3} 2E_{i}} \right] \frac{d^{3}k'}{(2\pi)^{3} 2E'} (2\pi)^{4} \delta^{4} \left(\sum_{i=1}^{X} l_{i} + k' - p - k \right) \right]$$
$$\sum_{i=1}^{N} \left[E' \frac{d\sigma^{\text{DIS}}}{d^{3}k'} = \frac{1}{2s} \left(\frac{1}{Q^{2}} \right)^{2} L^{\mu\nu}(k,k') W_{\mu\nu}(q,p) \right]$$

Leptonic tensor:

– known from QED

$$L^{\mu\nu}(k,k') = \frac{e^2}{2\pi^2} \left(k^{\mu}k'^{\nu} + k^{\nu}k'^{\mu} - k \cdot k'g^{\mu\nu} \right)$$

Unitarity – summing over all hard jets:

Interaction between the "past" and "now" are suppressed!

How to calculate the perturbative parts?

Use DIS structure function F_2 as an example:

$$F_{2h}(x_B, Q^2) = \sum_{q,f} C_{q/f}\left(\frac{x_B}{x}, \frac{Q^2}{\mu^2}, \alpha_s\right) \otimes \varphi_{f/h}\left(x, \mu^2\right) + O\left(\frac{\Lambda_{\text{QCD}}^2}{Q^2}\right)$$

$$\Rightarrow \text{ Apply the factorized formula to parton states: } h \rightarrow q$$
Feynman diagrams
$$\longrightarrow F_{2q}(x_B, Q^2) = \sum_{q,f} C_{q/f}\left(\frac{x_B}{x}, \frac{Q^2}{\mu^2}, \alpha_s\right) \otimes \varphi_{f/q}\left(x, \mu^2\right) \longleftarrow \text{Feynman diagrams}$$

 \diamond Express both SFs and PDFs in terms of powers of α_s :

$$\begin{array}{ll} \mathbf{0}^{\text{th}} \text{ order:} & F_{2q}^{(0)}(x_{B},Q^{2}) = C_{q}^{(0)}(x_{B}/x,Q^{2}/\mu^{2}) \otimes \varphi_{q/q}^{(0)}\left(x,\mu^{2}\right) \\ & & & \hline C_{q}^{(0)}(x) = F_{2q}^{(0)}(x) \\ \mathbf{1}^{\text{th}} \text{ order:} & F_{2q}^{(1)}(x_{B},Q^{2}) = C_{q}^{(1)}(x_{B}/x,Q^{2}/\mu^{2}) \otimes \varphi_{q/q}^{(0)}\left(x,\mu^{2}\right) \\ & & + C_{q}^{(0)}(x_{B}/x,Q^{2}/\mu^{2}) \otimes \varphi_{q/q}^{(1)}\left(x,\mu^{2}\right) \\ & & & \hline C_{q}^{(1)}(x,Q^{2}/\mu^{2}) = F_{2q}^{(1)}(x,Q^{2}) - F_{2q}^{(0)}(x,Q^{2}) \otimes \varphi_{q/q}^{(1)}\left(x,\mu^{2}\right) \\ & & & & \end{bmatrix} \\ & & & & & \\ \end{array}$$

Change the state without changing the operator:

$$\begin{split} \phi_{q/h}(x,\mu^2) &= \int \frac{dy^-}{2\pi} e^{ixp^+y^-} \langle h(p) | \overline{\psi}_q(0) \frac{\gamma^+}{2} U_{[0,y^-]}^n \psi_2(y^-) | h(p) \rangle \\ | h(p) \rangle \Rightarrow | \text{parton}(p) \rangle \qquad \qquad \phi_{f/q}(x,\mu^2) - \text{given by Feynman diagrams} \end{split}$$

- $\circ~$ It pins down the particle nature of quarks and gluons
- \circ But, not very sensitive to the detailed structure of hadron ~ fm
- Transverse confined motion: $k_{\tau} \sim 1/\text{fm} \ll Q$
- Transverse spatial position: $b_{\tau} \sim \text{fm} >> 1/Q$

□ Need new type of "Hard Probes" – Physical observables with TWO Scales:

$$Q_1 \gg Q_2 \sim 1/R \sim \Lambda_{\rm QCD}$$

- Hard scale: Q_1 To localize the probe particle nature of quarks/gluons
- "Soft" scale: Q_2 could be more sensitive to the hadron structure ~ 1/fm

Hit the hadron "very hard" without breaking it, clean information on the structure!

Semi-inclusive DIS (SIDIS)

Process:

$$e(k) + N(p) \longrightarrow e'(k') + h(P_h) + X$$

□ Natural event structure:

In the photon-hadron frame: $P_{h_T} \approx 0$

Semi-Inclusive DIS is a natural observable with TWO very different scales $Q \gg P_{h_T} \gtrsim \Lambda_{
m QCD}$ Localized probe sensitive to parton's transverse motion

Collinear QCD factorization holds if P_{hT} integrated:

Semi-inclusive DIS (SIDIS)

Perturbative definition – in terms of TMD factorization:

Transverse momentum dependent PDFs (TMDs)

Quark TMDs with polarization:

 $P_{h\perp}$

Hadron plant

 P_h

Quark Polarization

Semi-Inclusive DIS (SIDIS):

$$A_{UT} = \frac{1}{P} \frac{\sigma_{lN(\uparrow)} - \sigma_{lN(\downarrow)}}{\sigma_{lN(\uparrow)} + \sigma_{lN(\downarrow)}}$$

$$A_{UT}^{Collins} \propto \left\langle \sin(\phi_h + \phi_S) \right\rangle_{UT} \propto h_1 \otimes H_1^{\perp}$$

$$A_{UT}^{Sivers} \propto \left\langle \sin(\phi_h - \phi_S) \right\rangle_{UT} \propto f_{1T}^{\perp} \otimes D_1$$

$$A_{UT}^{Pretzelosity} \propto \left\langle \sin(3\phi_h - \phi_S) \right\rangle_{UT} \propto h_{1T}^{\perp} \otimes H_1^{\perp}$$

 $e(l) + N(P, \uparrow) \rightarrow e(l') + h(P_h) + X$ Photon-hadron frame Two planes Leptonic plane Hadronic plane Jefferson Lab

What can we learn from TMDs?

□ Intrinsic & confined parton motion:

- ✤ Fundamental information sensitive to how partons are bound together
- Responsible for dynamical contribution to emergent hadron properties, such as spin, mass, ..

Quantum correlation between hadron spin and parton motion:

Quark

Polarization

Exclusive lepton-hadron – Spatial imaging

Elastic e-p scattering – Electric charge distribution:

No color nucleon elastic form factor!

No proton color charge radius!

Spatial quark/gluon density distributions – imaging:

Spatial imaging of nucleon

Observables with identified hadrons – Phenomenology

Need QCD global analyses of all data on factorizable cross sections!

Drell-Yan Factorization

Drell-Yan process in QCD – factorization

Factorization – approximation:

Collins, Soper, Sterman, 1988

 \diamond Suppression of quantum interference between short-distance (1/Q) and long-distance (fm ~ $1/\Lambda_{ocd}$) physics

- \diamond Maintain the universality of PDFs: Long-range soft gluon interaction has to be power suppressed
- \diamond Infrared safe of partonic parts:

36

Cancelation of IR behavior Absorb all CO divergences into PDFs

$$\int d^4p_a\, \frac{1}{p_a^2+i\varepsilon}\, \frac{1}{p_a^2-i\varepsilon} \to \infty$$

Perturbatively pinched at

 $p_{a}^{2} = 0$

Active parton is effectively onshell for the hard collision

on-shell: p_a^2 , $p_b^2 \ll Q^2$; collinear: p_{aT}^2 , $p_{bT}^2 \ll Q^2$; higher-power: $p_a^- \ll q^-$; and $p_b^+ \ll q^+$ Jefferson Lab

Drell-Yan process in QCD – factorization

Leading singular integration regions (pinch surface):

Collinear gluons:

- Collinear gluons have the polarization vector: $\epsilon^{\mu} \sim k^{\mu}$ The sum of the effect can be
 - represented by the eikonal lines,

which are needed to make the PDFs gauge invariant!

Hard: all lines off-shell by Q

Collinear:

- $\diamond~$ lines collinear to A and B
- One "physical parton" per hadron

Soft: all components are soft

Trouble with soft gluons:

 $(xp+k)^2 + i\epsilon \propto k^- + i\epsilon$ $((1-x)p-k)^2 + i\epsilon \propto k^- - i\epsilon$

- Soft gluon exchanged between a spectator quark of hadron B and the active quark of hadron A could rotate the quark's color and keep it from annihilating with the antiquark of hadron B
- ◇ The soft gluon approximations (with the eikonal lines) need k^{\pm} not too small. But, k^{\pm} could be trapped in "too small" region due to the pinch from spectator interaction: $k^{\pm} \sim M^2/Q \ll k_{\perp} \sim M$ Need to show that soft-gluon interactions are power suppressed Jefferson Lab

Drell-Yan process in QCD – factorization

□ Most difficult part of factorization:

- ♦ Sum over all final states to remove all poles in one-half plane
 - no more pinch poles
- \diamond Deform the k^{\pm} integration out of the trapped soft region
- ♦ Eikonal approximation → soft gluons to eikonal lines
 - gauge links
- ♦ Collinear factorization: Unitarity → soft factor = 1

All identified leading integration regions are factorizable!
