Analytic Evolution of Singular Distribution Amplitudes in QCD

Asli Tandogan

Old Dominion University
Outline

1 Introduction
- QCD
- Deep Inelastic Scattering
- Factorization
- Evolution
- Main Points of the Talk
- Motivations

2 Evolution of Singular DAs
- ERBL Evolution Equation
  - The Non-Forward Evolution Kernel
- Evolution of Flat DA
- Evolution of Jumps

3 Evolution of Two-Photon GDA
- Two-Photon Generalized Distribution Amplitude (GDA)
- Jump part of GDA: $\Phi_1(x, \zeta; t)$
- Cusp Part of GDA: $\Psi_2(x, \zeta; t)$
- Result for Two-Photon GDA

4 DGLAP Evolution

5 Evolution of Double Distributions

6 Summary and Outlook
Quantum Chromodynamics

- Fundamental theory of strong interactions
- Non-Abelian gauge theory with gauge group SU(3)
- Force carriers: Colored gluons

\[ L_{QCD} = -\frac{1}{4} F_{\mu\nu}^{(a)} F^{(a)\mu\nu} + i \sum_q \bar{\psi}_q^i \left[ \gamma_\mu (D_\mu)_ij + i m \right] \psi^j_q \]

- \( F_{\mu\nu}^{(a)} = \partial_\mu A_\nu^a - \partial_\nu A_\mu^a - g_s f_{abc} A_\mu^b A_\nu^c \)
  (Field strength tensor)

- \( (D_\mu)_{ij} = \delta_{ij} \partial_\mu + ig_s \sum_a \frac{\lambda_{ij}^a}{2} A_\mu^a \)
  (Covariant derivative)
Running Coupling Constant

- Coupling constant $\alpha_s$ depends on $Q^2$
- A renormalization scale $\mu$ is introduced within perturbation theory

\[
\alpha_s(Q^2) = \frac{\alpha_s(\mu^2)}{1 + (\beta_0 \alpha_s(\mu^2)/4\pi) \ln(Q^2/\mu^2)}
\]

with

\[
\beta_0 = 11 - \frac{2}{3} n_f,
\]
Deep Inelastic Scattering

- Test of perturbative QCD
- Deep ⇒ Virtual photon can probe very small distances ($Q^2 \gg M_p^2$)
- Inelastic ⇒ Virtual photon destruct the target hadron ($W^2 \gg M_p^2$)
- General form of the scattering ⇒ $l + h \rightarrow l' + X$
- $l$ and $l'$ are leptons, $h$ is hadron target and $X$ is the sum of all possible hadron states.
Factorization

- Separation of long and short distances
- Short distances $\Rightarrow$ Perturbatively calculable
- Long distances $\Rightarrow$ Experimentally measurable

PDF + DA

- Parton Distribution Functions (PDFs): Probability densities to find a parton carrying a momentum fraction $x$
- Distribution Amplitudes (DAs): Describe how the longitudinal momentum of a fast-moving hadron is shared among constituents belonging to a particular Fock component
Illustration of Factorization

- Pion form factor $F_\pi(Q^2)$ at $Q^2$

$$F_\pi(Q^2) = \int_0^1 dx \int_0^1 dy \varphi^\dagger(y, Q^2) T(x, y, Q^2) \varphi(x, Q^2)$$

- $T_{\text{Born}}(x, y, Q^2) = \frac{4}{3} \frac{16\pi}{Q^2(1-x)(1-y)}$

- $\varphi(x, Q^2)$ is pion DA
Evolution equations predict the parton distributions for any scale $\mu'$ using the measured parton distribution at a scale $\mu$.

In order to describe this dependence of the parton distributions on the renormalization scale, $\mu$ and $\mu'$ should be large enough so that running coupling constants $\alpha_s(\mu)$ and $\alpha_s(\mu')$ are small.
Main Points of the Talk

- Developing an Analytic Method for Evolution of Singular DAs
- Application of the Method to Two-Photon Generalized Distribution Amplitude (GDA)
- Application of the Method to DGLAP Evolution
- Application of the Method to Evolution of Double Distributions
Motivations

- Why to Study Evolution of Singular DAs?
  - Modeling Generalized Parton Distributions (GPDs)
    - Non-analyticity of GPDs at the border $x = \pm \xi$ can cause cusps, jumps and delta functions
    - Inefficiency of well established standard way for non-singular DAs
  - Need for analytic method. Standard way is not efficient for singular DAs
- Why to apply the method to two-photon GDA?
  - Two-photon GDAs include some singular functions.
- Goal
  - Instead of relying on the numerical calculations for evolution of singular DAs we will have understanding about the evolution because of the analytic solutions
Diagramatic Expansions of the LO ERBL Kernel

\[ V_1(x, y) = \left( \frac{x}{y} \left( 1 + \frac{1}{y-x} \right) \right) \theta(x < y) + (x \rightarrow \bar{x}, \ y \rightarrow \bar{y}) \]

\[ V_2(x, y) = -\delta(y-x) \int_0^1 dz V_1(z, y) \]

\[ V_1(x, y) - \delta(y-x) \int_0^1 dz V_1(z, y) \rightarrow "+" \- Prescription \]
The non-forward Evolution Kernel and Evolution Equation

\[ V(x, y) = \left( \frac{x}{y} \left( 1 + \frac{1}{y - x} \right) \right)_+ \theta(x < y) + \left( \frac{\bar{x}}{\bar{y}} \left( 1 + \frac{1}{x - y} \right) \right)_+ \theta(y < x) \]

where \( \bar{x} \equiv 1 - x \) and \( V(x, y)_+ = V(x, y) - \delta(y - x) \int_0^1 V(z, y) dz \)

Explicit form of ERBL evolution equation:

\[
\frac{\partial \varphi(x, t)}{\partial t} = \int_0^1 [V(x, y)\varphi(y, t) - V(y, x) \varphi(x, t)] \, dy
\]

\[
= \int_0^1 V(x, y)[\varphi(y, t) - \varphi(x, t)] dy + \varphi(x, t) \int_0^1 [V(x, y) - V(y, x)] dy
\]

where \( t = 2 \ln \ln(\mu^2/\Lambda^2)/b_0 \)
Calculation of Evolution Equation

- Standard Way: Gegenbauer polynomial expansion
  - \( x(1 - x) C_n^{3/2}(1 - 2x) \) are eigenfunctions of evolution kernel
  - Oscillating functions: inefficient for expansion of singular DAs
  - Illustration of Gegenbauer expansion of a flat function
Calculation of Evolution Equation

- Alternative way: Iteration

\[
\varphi(x, t) = \sum_{n=0}^{\infty} \frac{t^n}{n!} \varphi_n(x)
\]

with the functions \( \varphi_n(x) \) satisfying the recurrence relation

\[
\varphi_{n+1}(x) = \int_{0}^{1} [V(x, y)] + \varphi_{n}(y) \, dy
\]

\[
= \int_{0}^{1} [V(x, y) \varphi_{n}(y) - V(y, x) \varphi_{n}(x)] \, dy
\]
Evolution of Flat DA

Rearranged evolution equation

\[
\frac{\partial \varphi(x, t)}{\partial t} = \int_0^1 V(x, y)[\varphi(y, t) - \varphi(x, t)] dy + \varphi(x, t) \int_0^1 [V(x, y) - V(y, x)] dy
\]

\[= \frac{3}{2} + x \ln \bar{x} + \bar{x} \ln x \equiv v(x)\]

⇒ The ansatz

\[\varphi(x, t) = e^{tv(x)} \Phi(x, t)\]

Equation for \(\Phi(x, t)\)

\[
\frac{\partial \Phi(x, t)}{\partial t} = \int_0^1 V(x, y) \left[ e^{t[v(y) - v(x)]} \Phi(y, t) - \Phi(x, t) \right] dy
\]

- \(\Phi(x, t)\) in series of \(t\)

\[
\Phi(x, t) = \sum_{n=0}^{\infty} \frac{t^n}{n!} \Phi_n(x)
\]

- Recurrence relation for \(\Phi_n(x)\)

\[
\Phi_{n+1}(x) = \int_0^1 V(x, y) \left[ \sum_{l=0}^{n} \frac{n!}{(n-l)! l!} \Phi_l(y) [v(y) - v(x)]^{n-l} - \Phi_n(x) \right] dy
\]
Evolution of Flat DA

From red to purple: $t = 0, t = 0.3, t = 0.6, t = 1.0$

(A.T, Radyushkin, 2011)
Evolution of Jumps: Simple Case

DA has a jump in $0 < x < 1$ interval

- Simplest example

$$\varphi_0^J(x) = \begin{cases} 
1 & 0 < x \leq 1/2 \\
-1 & 1/2 < x < 1
\end{cases}$$

- Contribution from the singular part of the kernel

$$\Phi_{1}^{J\text{\,sing}}(x) = \begin{cases} 
2 \ln \left[ \frac{1-2x}{x} \right] & \\
-2 \ln \left[ \frac{2x-1}{x} \right]
\end{cases}$$

- Ansatz

$$\varphi(x, t) = e^{2t(x \bar{x})^t} |1 - 2x|^{2t} \Phi(x, t)$$

$$\Phi_1(x) = -2 \ln \bar{x} \, \theta(0 < x \leq 1/2) - \{x \to \bar{x}\}$$
Evolution of Step Function

From red to purple: \( t = 0, t = 0.3, t = 0.6, t = 1.0 \)

(A.T, Radyushkin, 2011)
Evolution of Jumps: General Case

- More general jump structure
  \[
  \varphi_J^0(x, \zeta; a, b) = \begin{cases} 
  a & 0 < x \leq \zeta \\
  b & \zeta < x < 1
  \end{cases}
  \]

- Contribution from the singular part of the kernel
  \[
  \Phi_J^{\text{sing}}(x, \zeta; a, b) = \begin{cases} 
  (a - b) \ln \left[ \frac{\zeta - x}{(1 - x)\zeta} \right] \\
  -(a - b) \ln \left[ \frac{x - \zeta}{(1 - \zeta)x} \right]
  \end{cases}
  \]

- For jumping part
  \[
  \varphi_J(x, \zeta; a, b) = \frac{a - b}{2} e^{2t} (x \bar{x})^t \left[ \left( \frac{1 - x/\zeta}{1 - x} \right)^{2t} \theta(x < \zeta) \right. \\
  + \left( \frac{1 - \bar{x}/\bar{\zeta}}{1 - \bar{x}} \right)^{2t} \theta(x > \zeta) \left. \right] \Phi(x, \zeta) + \Psi(x, \zeta; t)
  \]
Evolution of Jumps: More General Case

- Function with antisymmetric jumps at $x = \zeta_i \Rightarrow$ Ansatz
  \[
  \varphi(x, t) = \Phi(x, t) + e^{t[v(x) + w(x)]}\Phi_0(x) + \Psi(x, t)
  \]
  \[
  \text{regular function vanishing at } t=0
  \]

- Corrections to this approximation can be found by
  \[
  \Psi(x, t) = \sum_{n=1}^{\infty} \Psi_n(x, t), \quad \Psi_1(x, t) \equiv t\chi(x) + \delta\Psi_1(x, t)
  \]

- Final ansatz $\varphi(x, t) = \Phi(x, t) + \chi(x) + \delta\Psi(x, t)$
  \[
  \text{smooth part} + \text{remainder}
  \]
Main Points of the Talk

- Developing an Analytic Method for Evolution of Singular DAs ✓
- Application of the Method to Two-Photon Generalized Distribution Amplitude
- Application of the Method to DGLAP Evolution
- Application of the Method to Evolution of Double Distributions
Two-Photon Generalized Distribution Amplitude (GDA)

- **GDA**: describes the transition of a quark-antiquark or a gluon-gluon pair into a photon pair

\[ \psi^{q}(x, \zeta, Q^{2}) = N_{C} e_{q}^{2} \frac{e^{2}}{2\pi^{2}} \log \frac{Q^{2}}{m^{2}} \varphi(x, \zeta) \]

\[ \Rightarrow \varphi(x, \zeta) = \frac{x(2x-\zeta)}{\zeta} \theta(x - \zeta) \]
\[ + \frac{x(2x-\bar{\zeta})}{\zeta} \theta(x - \bar{\zeta}) \]
\[ - \frac{x(2\bar{x}-\zeta)}{\zeta} \theta(\zeta - x) \]
\[ - \frac{x(2\bar{x}-\bar{\zeta})}{\zeta} \theta(\bar{\zeta} - x) \]

- In lowest order, non-singlet vector part of two-photon GDA
Two-Photon Generalized Distribution Amplitude (GDA)

- $\Phi(x, \zeta)$
- Jump Part
  - $\Phi_{1,0}(x, \zeta = 0.3)$
- Cusp Part
  - $\Phi_{2,0}(x, \zeta = 0.3)$
Jump part of GDA: $\Phi_1(x, \zeta; t)$

$$\Phi_{1,0}(x, \zeta) = -\frac{x}{2\zeta} \theta(0 < x < \zeta) + \frac{\bar{x}}{2\zeta} \theta(\bar{\zeta} < x < 1) + \frac{1 - 2x}{2(1 - 2\zeta)} \theta(\zeta < x < \bar{\zeta})$$

- Straightforward first iteration

$\Phi_{1,1}(x, \zeta = 0.3)$
Jump part of GDA: $\Phi_1(x, \zeta; t)$

Summation of the divergent terms:  
$$ 2(\ln |x - \zeta| + \ln |x - \bar{\zeta}|)\Phi_1(x, \zeta) $$

$$ e^{t[v(x)+w(x)]} \Phi_0(x) \Rightarrow w_0(x, \zeta) = 4 + 2 \ln |x - \zeta| + 2 \ln |x - \bar{\zeta}| $$

$\Psi^{(0)}_{1,1}(x, \zeta = 0.3)$

FINITE JUMPS
Jump part of GDA: $\Phi_1(x, \zeta; t)$

- Explicit calculation gives

$$
\Psi_{1,1}^{(0)}(\zeta_+, \zeta) - \Psi_{1,1}^{(0)}(\zeta_-, \zeta) = 4 + 2 \ln(|1 - 2\zeta|)
+ (2 - \zeta) \ln \zeta + (2 - \bar{\zeta}) \ln \bar{\zeta} \equiv -w_1(\zeta)
$$

- Adding $w_1(\zeta)\Phi_{1,0}(x, \zeta)$ to $\Psi_{1,1}^{(0)}(x, \zeta)$, $\Rightarrow \chi(x, \zeta)$ continuous

\[\Psi_{1,1}(x, \zeta = 0.3)\]
Jump part of GDA: $\Phi_1(x, \zeta; t)$

$\Phi$-part of the Ansatz $\varphi(x, \zeta, t) = \Phi(x, \zeta, t) + \Psi(x, \zeta, t)$

$$
\Phi_1(x, \zeta, t) = e^{tv(x)} \left( \frac{|1 - x/\zeta| |1 - x/\bar{\zeta}|}{|1 - 2\zeta|} \right)^{2t} \zeta^t \bar{\zeta}^t \Phi_{1,0}(x, \zeta)
$$

From red to purple: $t = 0, t = 0.2, t = 0.3, t = 0.5$
Jump part of GDA: $\Phi_1(x, \zeta; t)$

Correction due to the $\Psi$ term from $\varphi(x, \zeta, t) = \Phi(x, \zeta, t) + \Psi(x, \zeta, t)$
Jump part of GDA: $\Phi_1(x, \zeta; t)$

\[ \delta \Psi_1(x, \zeta = 0.3, t = 0.2) \]

\[ \Phi(x, \zeta = 0.2, t = 0.2) \]

\[ \Phi + \delta \Psi_1 + \delta \Psi_2 \]

\[ \Psi(x, \zeta, t) \approx t \chi(x, \zeta) \quad \sqrt{\text{ }} \]
Cusp Part of GDA: $\Phi_2(x, \zeta; t)$

$$\Phi_{2,0}(x, \zeta) = \frac{-x(1 - 4x + 5\zeta - 4\zeta^2)}{2\zeta\zeta} \theta(\zeta - x) - \frac{\bar{x}(3 - 4x - 5\zeta + 4\zeta^2)}{2\zeta\zeta} \theta(x - \bar{\zeta})$$

$$- \frac{(1 - 2x)(1 + \zeta - 4\zeta^2)}{2\bar{\zeta}(1 - 2\zeta)} \theta(x - \zeta) \theta(\bar{\zeta} - x)$$
Cusp Part of GDA: $\Phi_2(x, \zeta; t)$
Cusp Part of GDA: $\Phi_2(x, \zeta; t)$

From red to purple: $t = 0, t = 0.2, t = 0.3, t = 0.5$
Result for Two-Photon GDA

\[ \Psi^q(x, \zeta; t) = \Psi_1(x, \zeta; t) + \Psi_2(x, \zeta; t) \]

\( \varphi(x, \zeta = 0.4, t) \)

From red to blue: \( t = 0, t = 0.1, t = 0.2 \)
Main Points of the Talk

- Developing an Analytic Method for Evolution of Singular DAs ✓

- Application of the Method to Evolution of Double Distributions
LO quark-quark DGLAP kernel: A quark with momentum fraction $x$ could have come from a parent quark with a larger momentum fraction $y$. Usual way to write evolution equation in DGLAP region is

$$\frac{df(x, t)}{dt} = \int_x^1 \frac{dy}{y} P\left(\frac{x}{y}\right) f(y)$$

Rewrite the evolution equation ($P(x/y) = P(x, y)$)

$$\frac{df(x, t)}{dt} = \int_0^1 \frac{dy}{y} P(x, y)[f(y) - f(x)] + f(x) \int_0^1 \left[ \frac{P(x, z)}{z} - \frac{P(z, x)}{x} \right] dz$$
Evolution of Typical PDF \((1 - x)^3\)

**Ansatz** 
\[ f(x, t) = e^{(x+1/2)t}x^{2t}x^{-t}F(x, t) \]

From red to purple: 
\( t = 0, t = 0.2, t = 0.4, t = 0.5 \)

- Application of the Method to Evolution of Double Distributions
Nonforward matrix element $\langle p - r \mid \mathcal{O}(0, z) \mid p \rangle \big|_{z^2 = 0}$ can be parametrized by DDs.

Integration over $y \Rightarrow$ PDFs
$$\int_0^{1-x} R^{ab}(x, y; \xi, \eta) \, dy = \frac{1}{\xi} P^{ab}(x/\xi)$$

Integration over $x \Rightarrow$ DAs
$$\int_0^{1-y} R^{QQ}(x, y; \xi, \eta) \, dx = V^{QQ}(y, \eta)$$
Evolution of Double Distributions

- **Double Distribution kernel**

\[
R^{QQ}(x, y; \xi, \eta) = \frac{\alpha_s}{\pi} C_F \frac{1}{\xi} \left\{ \begin{array}{l}
\theta(0 \leq x/\xi \leq \min\{y/\eta, \bar{y}/\bar{\eta}\} \\
+ \frac{\theta(0 \leq x/\xi \leq 1)x/\xi}{(1 - x/\xi)} \left[ \frac{1}{\eta} \delta(x/\xi - y/\eta) + \frac{1}{\bar{\eta}} \delta(x/\xi - \bar{y}/\bar{\eta}) \right] \\
- \delta(1 - x/\xi)\delta(y - \eta) \left[ \frac{1}{2} + 2 \int_0^1 \frac{z}{1-z} \, dz \right] \end{array} \right. 
\]

- **Some algebra + rearranging**

\[
\frac{\partial F(x, y; t)}{\partial t} = \int_y^{y+x} \frac{d\eta}{\eta - y} \left[ F \left( \frac{x\eta}{y}, \eta; t \right) - F(x, y; t) \right] + \int_0^y \frac{d\eta}{y - \eta} \left[ F \left( \frac{x\bar{\eta}}{\bar{y}}, \eta; t \right) - F(x, y; t) \right] + F(x, y; t) \left[ 2 + \ln \left( \frac{y(1 - x - y)}{\bar{y}(x + y)} \right) \right]
\]
Evolution of $[y(1 - x - y)]^{10}$
Summary and Conclusion

- We described an analytic method for evolution of singular DAs which appear in models for GPDs
  - Logarithmic singularities are summed from the start, which produces a continuous curve.
  - Unlike the standard method which needs an infinite amount of terms for singular DAs, our method requires only one or two iterations for precise results.
- We applied our method to GDAs
  - With just one or two iterations, we obtained more accurate results than the existing numerical method for evolution of two-photon GDA
- We illustrated application of the method to DGLAP evolution and evolution of DDs
Results are presented in the following publications:
